CIRCULATES EVERYWHERE IN CANADA

CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields, Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

MONTREAL, Eastern Townships Bank Bldg. TORONTO, 143-149 University Ave. WINNIPEG, 34 Royal Bank Bldg. LONDON, ENG., 88 Fleet St., E.C.

Vol. XI Publication Office: Toronto, January 1, 1914 No. 1

Our Spot Light Message

This position is the "spot light" on the stage of Canadian industrial publicity.

¶ It is the most valuable space in the entire paper, and, like the inside pages, is worth infinitely more than we charge, because it is possible to produce here an effect which cannot be measured in money, which cannot be judged by surface indications, and on which no narrow restricted value can be placed.

¶ For this issue we have reserved the "spot light" for our own message, because we believe it is worthy the best position we can give it. The front cover is ordinarily occupied by leading manufacturers, and it is about these and about the progressive firms whose advertisements appear throughout "Canadian Machinery" that we wish to speak.

¶ The shortest cut and the logical way of reaching buyers of mechanical lines is through the medium of "Canadian Machinery," and you can rely upon it that the manufacturer who adopts this modern plan of marketing his products is also using modern and efficient methods in producing the thing he has to sell.

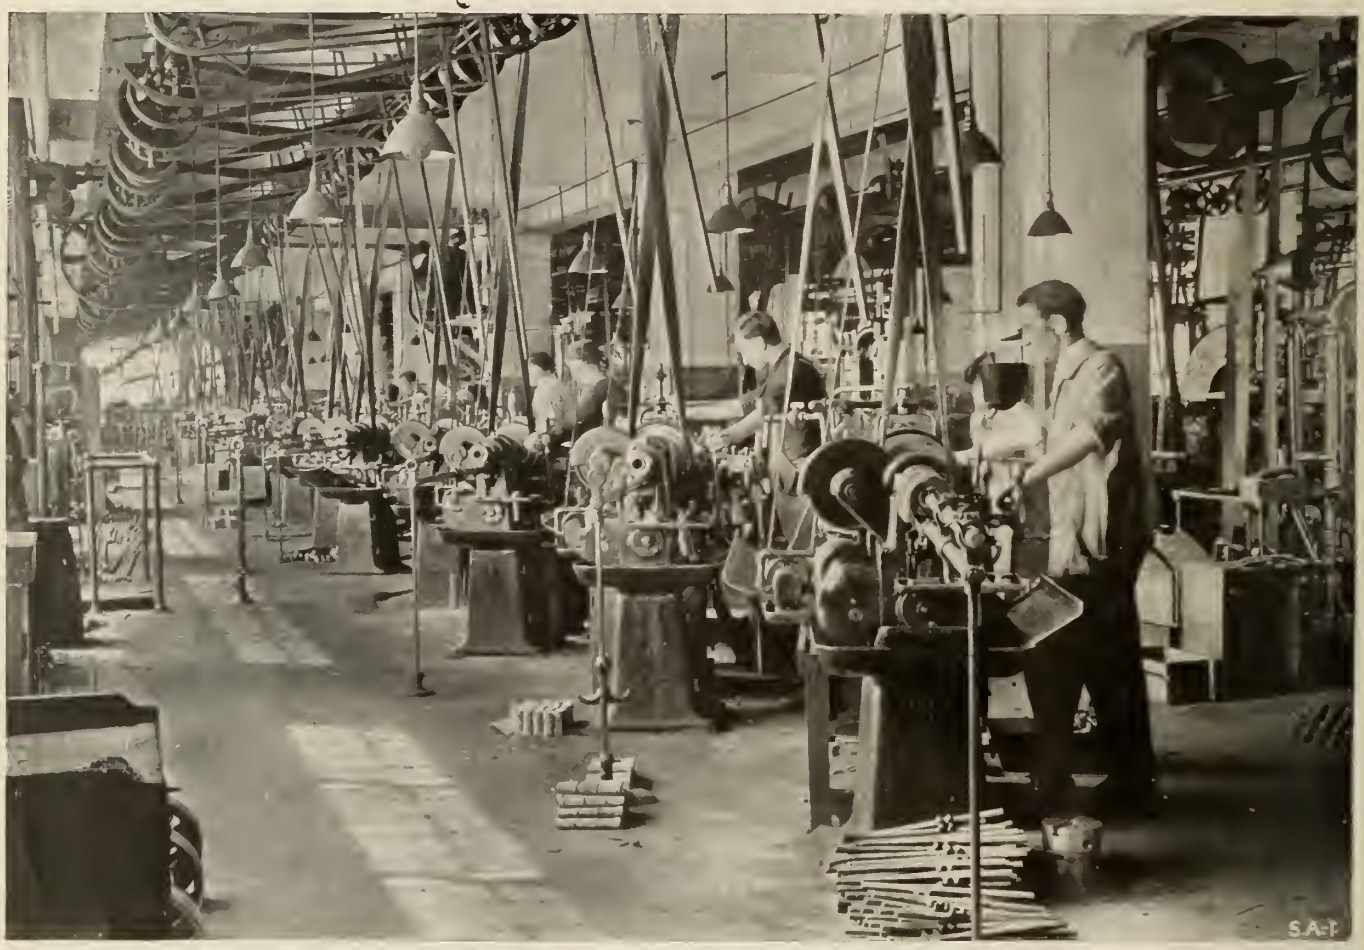
¶ The advertiser has a larger output than the non-advertiser, and, consequently can purchase raw material cheaper, can introduce economic methods in manufacturing and can market his products with less expense. Does it not follow, then, that the advertiser is the best producer and is able to give you the best for the least money?

¶ After all, advertising is but the supreme expression of a manufacturer's confidence in his product, and any manufacturer who has confidence enough in his product to give it general publicity deserves the confidence of the general public.

¶ The advertiser has pride in his product and stands ready to back up the printed word and illustration. He is willing to subject it to the criticisms of the world. Eventually, he knows he will win out, and he always does.

¶ If you would keep abreast of the development in things mechanical, read the advertisements in "Canadian Machinery."

¶ If you would purchase a satisfactory machine, buy one that is advertised herein.



¶ If you would deal with modern, progressive, liberal minded manufacturers, then connect with an advertiser.

¶ This is our "spot light" message. Include it in your list of New Year Resolutions, and you will find 1914 exceedingly profitable.

P. & W. Turret Lathes

Doing Excellent Work in Auto Shops

Easily and conveniently operated, provided with adequate tool accommodations and of rigid, durable construction throughout.

Battery of P. & W. Turret Lathes in a large automobile plant, proving very efficient on rod work.

Convenient Speed Control

On 1½" machines and above, double back gears in additio nto 3-speed counter make 27 speeds available; nine speeds can be instantly obtained without shifting belts. Spindle instantly started or stopped by back gear lever within easy reach. Clutches of expanding ring type—simple, convenient to adjust and easy to operate.

Automatic Rod Clutch.

Combines extraordinary gripping power, extreme accuracy and durability with ease of operation. All parts are hardened and ground, including collet and chuck jaws.

Quick Operating Rod Feed.

Improved type hand operated device gives rapid and positive feed. Most efficient and durable. For 2" and 3" sizes automatic rod feed of screw type may be furnished. Very quick and positive in action. Handles rods any shape, rough or smooth.

Accurate Stock Stop

Arm carrying stop swings down from head and does not interfere with tools. Very rigid and allows no variation to length of pieces.

Automatic and Hand Indexing

Turret is indexed automatically by simply running back turret by spider. This mechanism can be released and turret rotated either forward or backward by hand.

Rigid Turret Binder

Turret is rigidly clamped to seat by most efficient device, conveniently operated by handle on top of turret. Absolutely no looseness or vibration of turret while tools are in operation. This means increased accuracy.

Positive Turret Stops

Conveniently located on front of machine. Positive in action and easily adjusted. Power feed may also be instantly engaged or disengaged by hand by means of convenient lever.

Adequate Tool Accommodation.

Tools are rigidly held to turret by dove-tailed faces and gibs, efficiently backing up tools and arresting twisting strains. Rigid means are provided for holding round shank tools.

Your Pride—and Ours

A Little New Year's Talk.

Just at the new year it will do us all good to sit down and think—think of what we did last year and what we will do this year.

Take your own case. Are you proud of the way you handled your business problems?—did you get the salary increase you wanted?—did you successfully carry increased responsibility?

Now, either you *are* proud of what you accomplished and can look forward to a new year feeling competent to meet it, or else you feel that you have *not* accomplished your best and will use the new year as a fresh opportunity to play life's game, so that you will be proud of it.

Unless you *are* proud of what you did last year or are anxious *to be* proud of your showing for the new year, you are driftwood — you have lost your grasp on living — you are just existing.

Of our own work last year we are frank to say we are proud. We did more business, invented new tools, and perfected old ones, built additions to our plant, and we still more firmly secured the loyalty of all our workers who keep the wheels turning. This year we want to beat all records—more business, new tools, more buildings, and we want to continue our perfect relations with all our employees. We feel that only by keeping our ideals high and by hustling can we maintain our reputation as the World's Greatest Tool Makers.

Our purpose in talking ambitions and ideals with you instead of micrometers and surface gages is this: If you are anxious to produce more work and better work you need more and better equipment. We want you to feel, to realize, and to know that our tools are in all ways supreme. They are mechanically perfect in accuracy. They are designed for widest range of service and they are made to last.

Let's all of us who take pride in our work, get together. Here's hoping that we can help each other be proud of 1914.

The World's Greatest Tool Makers

Double Over-Arm, Flanged Spindle, Cascade Lubrication

These are three of the most effective of Milwaukee Miller features. Yet the milling machine user must not lose sight of the fact that these features can get the excellent results they do only by reason of the thoroughness and careful attention to every detail with which our machines have been designed and constructed.

Milwaukee Millers

Take the Double Over-Arm construction, for instance:

Through it, we provide a means of aligning the cutter arbor positively and so eliminate the unsatisfactory practice of having the arbor align the bearings.

It also permits the use of large, coarse pitch cutters on rough heavy work at a much greater distance from the column than has heretofore been practicable, and eliminates the tendency of coarse cutters on heavy work to pound the bearing gradually out of line.

These results mean greater durability and a higher degree of accuracy. But the durability and accuracy are primarily dependent upon the construction that supports this over-arm and the work.

The column of Milwaukee Millers is cast in *one* piece with strong integral ribs. It is a box section of increasing depth as it extends downward to the pan shaped base. The base is given sufficient height from the floor to allow heavy ribs to be used.

The knee also is one piece box section and has its bearing on the column above the top plate of the knee, thus giving greater resistance to distortion. There are no holes or slots in the top plate of the knee.

By making the column in one piece with enclosed base, we are enabled to use our cascade system of lubrication, a feature of great importance.

The lubricant is pumped to the top of the machine and distributed by a perforated pipe. It then cascades downward over all the gears and bearings, keeping them cool and flushing away all foreign substances that might cause heating and scoring of the surfaces.

Then again, in addition to this lubrication system we use hardened steel gearing throughout, a speed arrangement that it is almost impossible to wear out when so lubricated and flushed.

In this way the various unique features and carefully designed details of Milwaukee Millers mesh into one another to produce the excellence of the completely assembled Machine.

The complete facts regarding these features and details prove mighty interesting reading to the milling machine user. Write for our Bulletins.

New Plant of the H. Mueller Manufacturing Co., Sarnia, Ont.

Staff Article

The new factory which the H. Mueller Mfg. Co. have built at Sarnia, Ont., is another instance of American enterprise in the Canadian industrial sphere. It is further evidence of the confidence which manufacturers across the line have in the Canadian market.

THE new factory at Sarnia, Ont., built by the H. Mueller Mfg. Co., Ltd., went into operation on June 1, 1913. It is perhaps the most modern and best equipped factory in Canada for manufacturing all kinds of plumbers' supplies and steam, water and gas specialties. The H. Mueller Mfg. Co., of Decatur, Ill., the parent concern, have a reputation for high quality goods and it is the aim of the Canadian company to live up to the same standard; with this end in view they have built and equipped the plant here described.

The foundation of the parent business may be traced back some years ago when H. Mueller invented and manufactured an apparatus for drilling and tapping holes in water mains when under pressure. This machine, in an improved form, although the same in principle, has been retained, and is to-day one of the company's chief products. A large number of these machines now in use were made at Decatur. From that time, the business has made rapid progress until now it is even perhaps the largest firm in the United States making plumbers' supplies. During the construction of the factory at Sarnia, Mr. O. B. Mueller lived for a greater part of the time, in a house on the site, known to many as "the 49." It still stands, and is now used as an office.

The company purchased a site covering 73 acres on what was part of an Indian reservation to the south of the town of Sarnia and outside the town limits. The property lies on both sides of the Pere Marquette Railway, and has a frontage of 1,200 ft. on the St. Claire river. Ten acres were sold at a later date, five acres were appropriated for the present plant, and the rest is being held for future extensions. On part of the property was an old chain works which has been converted into a modern shop, now known as the iron finishing shop. A siding from the railway runs through the property and shipping facilities are further improved by the dock on the river front. It is the intention of the company, later, to build a three storey building on the river front, the bottom floor of which will be on the dock level and will be used as a shipping room. This will considerably improve the shipping provision for goods destined for the western market. At the present time about 100 men are employed, and the prospects are decidedly encouraging.

INTERIOR OF BRASS FOUNDRY.

Buildings.

The plant and buildings were designed and laid out by Prack & Perrine, factory engineers, Hamilton, Ont., while the construction was carried out by local contractors and the equipment installed under the supervision of the Company. The buildings are of reinforced concrete and brick construction with steel roof trusses and concrete roofs, making them practically fireproof. They are all one storey high and so have the benefit of a roof light in addition to the windows which extend the full length of the buildings and are fitted with Kahn steel sash and factory ribbed glass. The roof of the brass finishing shop is of the saw-tooth type and the foundry has a monitor roof for about 128 feet, the remainder being of saw-tooth construction. In the iron finishing shop, the old peaked roof has been retained but additional windows have been added. Concrete floors are laid in all the shops. The layout of the plant as will be seen from the illustrations provides for a continuous movement of the products in one direction. From the core room to the stock room, the equipment is so arranged that the operations follow each other in regular sequence.

The iron finishing shop is 250 ft. by 44 ft., with an office adjoining, 50 ft. x 35 ft. which is taken up by the drawing and superintendent's offices. On the east side of the property and parallel to the railway is the foundry 192 ft. x 60 ft., and on the north side is the brass finishing shop 276 ft. x 60 ft. and temporary offices 26 ft. x 18 ft. The power

house at the south end of the property is 76 ft. x 66 ft., beyond which is the fuel oil storage near the tracks. The enamelling shop is situated in the middle of the yard or concourse. An industrial track system is laid through each shop and connection is made with each by turntables.

Tunnel System.

A system of tunnels has been constructed between the power house and the various buildings. The tunnels, of reinforced concrete construction, are of sufficient height to permit walking through and strong enough to allow teams to pass over. The interior has been waterproofed and is perfectly dry. The tunnels were built to carry all the steam, air and water piping and electrical wiring to the shops, the obvious advantage being that all pipes, etc., are accessible and digging is eliminated when additional pipes have to be installed, or repairs require making. In the tunnel are laid all the wires for lighting and power purposes, also the 5 in. live steam pipes for the engines driving the ventilating system fans; the 10 in. low pressure steam pipes for the heating coils, and the 6 in. pipes carrying the returns from the heating coils back to the vacuum pump in the engine room. Electric lamps are installed at certain intervals to allow for close inspection of piping and wiring.

POLISHING AND PLATING DEPARTMENT.

Iron Finishing Shop.

In the iron finishing shop are made most of the tools such as cutters, reamers, dies, chasers, etc., that are used in the manufacture of the product. The Company have in many cases their own special methods for certain operations and so require special tools. The tool department occupies the larger part of this building and is equipped with the necessary apparatus which comprises two natural gas furnaces for hardening and tempering cutters, reamers, etc. In connection with the furnaces is a No. 4 "Sturtevant" high pressure belt-driven blower. The furnaces were supplied by the American Gas Furnace Co., New York. In this department there is a foreman's office and tool stores. There are also several machine tools, which include a Le Blond miller, lathes, by the Hendey Machine Co., Torrington, Mass., a Brown & Sharpe universal miller, a "New Yankee" drill grinder, "Universal" bath grinder, milling machines by Kearney & Trecker, Milwaukee, and several stand grinders.

At the south end of this building is a stock room for shop supplies and the north end is devoted to pattern making. In the west side between the superintendent's office and the main building is a room equipped with a row of lavatories which are equipped with Mueller fittings.

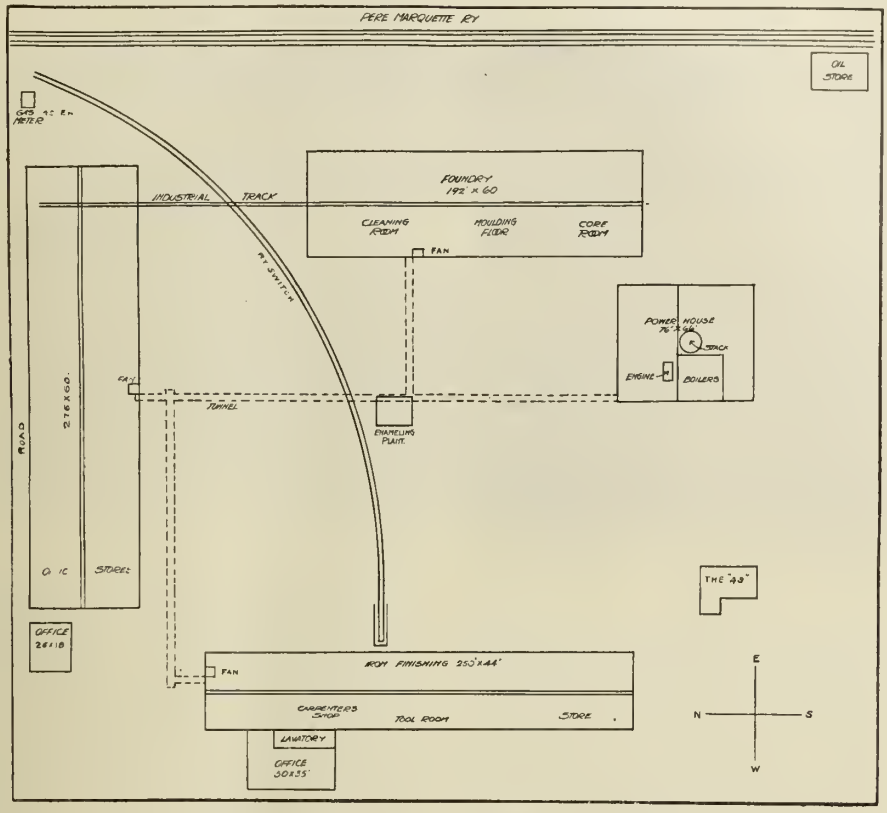
The Foundry.

The foundry is devoted exclusively to the production of brass castings. At the south end is the core room containing several portable core benches, steel core racks and a natural gas heated core drying oven which is equipped with a steel hood and stack. In another section are installed a Gould & Eberhardt core sand mixer and resin crusher supplied by the W. W. Sly Mfg. Co., Cleveland. These machines are driven by a 5 h.p. motor. A machine for bending core wires will be installed later.

In the molding section is a No. 40 "Schwartz" oil fired brass melting furnace, air being supplied by a No. 1 "Sturtevant" high pressure blower operating at 425 r.p.m. The blower is driven through gears by a C. G. E. motor running at 860 r.p.m. Above the furnace is a steel hood and stack for carrying off the fumes. Near the "Schwartz" furnace is a pit furnace for melting brass in crucibles, with a steel stack in connection. Along the west wall are a number of core benches and squeezers with a compressed air installation.

At the north end is the cleaning room where are installed the tumbling mills, made by the Company, grinders, and a "Bliss" press for breaking off the gates, etc., on the castings. Here also is a "Dings" motor driven magnetic separator for removing particles of iron that may be in the brass scrap. This machine was supplied by the Dings Electro-Magnetic Separator Co., Milwaukee.

INTERIOR OF TOOL MAKING DEPARTMENT.



Brass Finishing Shop.

In the brass finishing shop, the castings are machined, polished, and tested, and in the store room at the west end are stored preparatory to shipping. The castings are wheeled in from the cleaning room to the brass finishing department at the east end of the shop. When operations have been completed there, they are taken to the polishing and buffing machines, then to the assembly department near which is the test bench. On the opposite side of the shop from the assembly department is the nickel-plating department where all plated goods are treated.

In the brass finishing department are several standard tools and also some special types. The former include Warner & Swasey turret lathes, a three spindle drill by A. R. Williams Machinery Co., drills by Canadian Fairbanks-Morse Co., and an automatic machine by the New Britain Machine Co. Along the north side of the building are several buffing machines, and nearer the centre are a row of polishing machines. All these were supplied by the Bennett-O'Connell Co., Chicago, and are each equipped with galvanized iron hoods and ducts for removing the dust. In connection with this system are two motor driven Sturtevant blowers which carry the dust from the machines through the ducts to the dust catchers on the roof outside, the dust being returned to the shop by a down pipe to have the brass particles taken out.

All the goods sold by the Mueller Co. are covered by an unconditional guarantee which they are able to do as each fitting is tested by hydraulic pressure before shipment. The testing bench in this shop has stands for holding various kinds of bibbs, cocks, etc., and is equipped with a "Deming 3 in. x 3 in. motor driven triplex pump, which is connected to the test stands. The testing outfit is equipped with gauges and "Mueller" water pressure regulators.

The stock and shipping room at the west end of this building is equipped with steel racks, arranged in divisions each holding four steel stock or "tote" boxes. The racks and boxes were made by the Company in accordance with the system which they have in force in the stock room at Decatur. Each box is numbered and its contents noted in the stock record from which can be seen at a glance the kind and quantity of goods in each box. When the quantity has reached a certain limit, an order is put through on the shops for a further supply.

LAYOUT OF THE H. MUELLER MFG. CO. PLANT.

In this building is a "Curtis" vertical belt driven air compressor having a capacity of 150 ft. of free air per minute. Air is piped to the other shops through the tunnel. The Company contemplate installing a larger unit in the near future. A row of enamelled iron lavatories, equipped with "Mueller" fittings, is installed in this shop.

The Power Plant.

As already stated, the power house is 76 ft. x 66 ft. and is divided into two sections by a brick wall; one side, the north, forming the engine room and the other side containing the boilers, heater and pumps. The base of the chimney is also in this latter section. The walls are of brick construction up to half way, above which line are windows fitted with steel sash and ribbed glass, extending all round the building and giving a very bright effect to the interior. Many of the windows open, giving good ventilation. The absence of coal in the boiler room, natural gas being used, gives the plant a clean and tidy appearance. There is ample space for installing a complete duplicate set when the necessity arises.

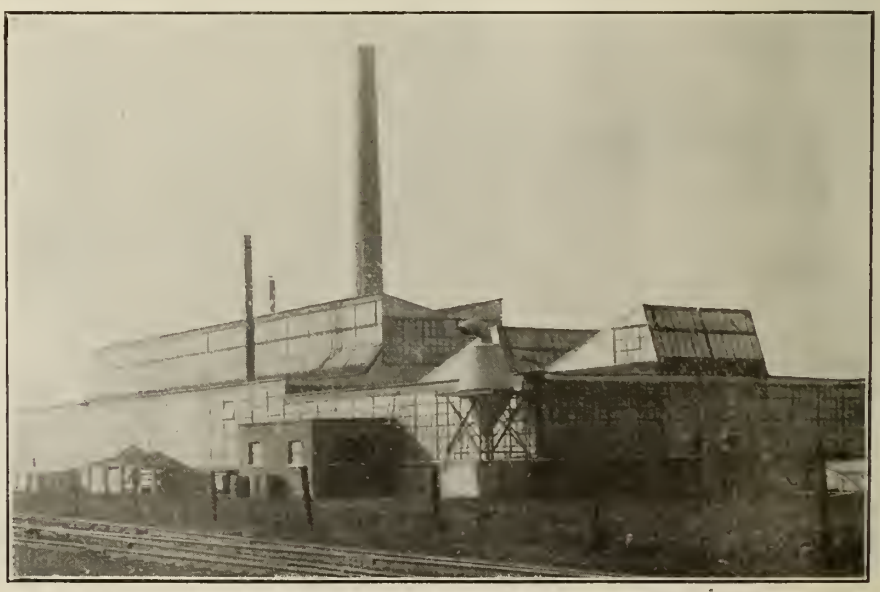
In the engine room is installed a Robb compound vertical high speed engine, direct connected to a Canadian General Electric 187 k.v.a., 60 cycle, 3 phase, 450 r.p.m. generator and a C.G.E., 125 volt exciter. The engine is rated at 200 i.h.p., running 450 r.p.m at 140 pounds

VIEW OF PLANT SHOWING FOUNDRY AND POWER HOUSE.

steam pressure. It is equipped with forced lubrication, a "Sweets" throttle governor, and has cylinders 13 in. x 19 in. diam. x 9 in. stroke. The International Engineering Works, Ltd., Amherst, N.S. supplied the engine. The usual gauge board with pressure gauges and clock are of course located in the engine room.

In the boiler room are two Sterling water tube boilers each rated at 250 h.p. and having working pressure of 140 pounds. They are fitted with "Kirkwood" burners for natural gas at a pressure of 8 ozs., a gauge being fitted for indicating the pressure. There are 10 burners to each boiler and these were supplied by Tate, Jones & Co., Pittsburgh. Martin shaking grates are fitted in case it should be necessary in an emergency to change over from gas fuel to coal, the burners being so arranged that the change can be made in a few minutes. Near the boilers is a 600 h.p. "Cochrane" open type feed water heater fitted with a multi-port safety exhaust on the valve and in connection with it are two 6-4-7 duplex boiler feed pumps. The heater and pumps were supplied by the Canadian Allis-Chalmers Co. The pumps deliver feed water to the boilers at 210 degrees under the control of a "Copes" feed water regulator, and are each fitted with a "Mueller" pump governor, made in their factory. "Powell" non-return valves are fitted in the steam leads to the header and the pipe lines are equipped with "Kiely" high pressure steam traps.

The steam pipes and fittings were furnished by the Canadian Kellogg Co., Ltd., Montreal, and are covered with the Kisselguhr Co., "Nonpareil" pipe covering. All the valves were supplied by the Wm. Powell Co., Cincinnati. The radial brick chimney 125 ft. high and 14 ft. diameter at the base, inside, was built by the Heinicke Co., New York. A high pressure 5 in. steam line is carried through the tunnel to the fan engines, and a 10 in. low pressure line from the engine exhaust to the heating coils. These pipes are carried on racks in the tunnel and on the high pressure line is a "Mueller" reducing valve for reducing the steam pressure from 140 to 100 pounds. The low pressure pipe is fitted with a "Mueller" regulator which allows live steam to enter the line if there is a deficiency of exhaust steam. The regulator is fitted with a strainer and is one of the company's specialties. A "Marsh" vacuum pump is installed at the engine room end of the tunnel to return drains from the heating coils to the heater. The pump was supplied by the A. R. Williams Machinery Co.



CORE DEPARTMENT.

Power and Light Distribution.

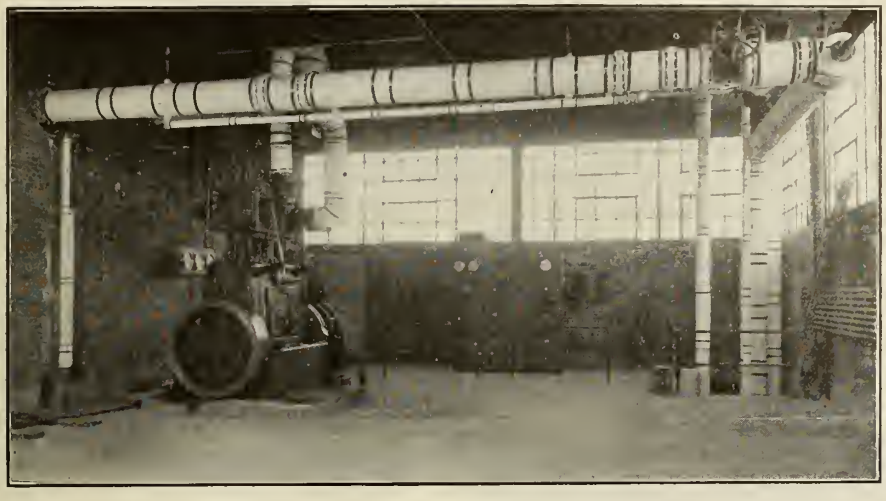
In the engine room is a switchboard, which consists of four panels of black marine slate, each panel having two slabs, 25 in. and 65 in. respectively, by 2 in. thick, with ½ in. bevel edges. The first panel is 24 in. wide, and controls the 175 k.v.a. 60 cycle, 440 volt generator and exciter. On this panel is mounted the following: One 3-pole, single throw, 300 amp. automatic breaker; one field discharge switch; one type (F) ammeter, 300 amps.; one voltmeter receptacle; three ammeter receptacles and plugs; one type (F) voltmeter. The second panel is blank, while the third and fourth are feeder panels. At the back of the switchboard are three 10 k.w. and one 30 k.w. single phase Canadian Westinghouse transformers, which reduce the current from 440-220-110 volts. The former set include one transformer for each shop, and the latter is for using with outside current. In each shop are installed 150 watt wire drawn "Mazda" lamps with D'Oblier holophane reflectors, suspended in the centre of the shops in single units and spaced about 20 ft. apart. The lamps are supplied with single phase current at 110 volts and are controlled from a distributing panel in each building. Lead covered cables are laid in the tunnel from these panels to the main switchboard in the engine room.

C. G. E. induction motors, 440 volts, are installed in the various buildings. In the machine shop a 20 h.p. and 7½ h.p. motor drive the line shaft and in the brass finishing shop 20 h.p. and 30 h.p. motors drive the line shaft, while two 15 h.p. motors drive the blowers in connection with the dust removing system and a 5 h.p. motor drive the "Deming" pump on the test bench. In the foundry, a 15 h.p. motor drives the line shaft, a 7½ h.p. motor operates the blower in connection with the dust removing system installed with the grinders, a 5 h.p. motor drives the machine in the core room, and a ½ h.p. D.C.

EXTERIOR OF BRASS FOUNDRY.

motor operates the "Dings" magnetic separator.

Heating and Ventilating System.



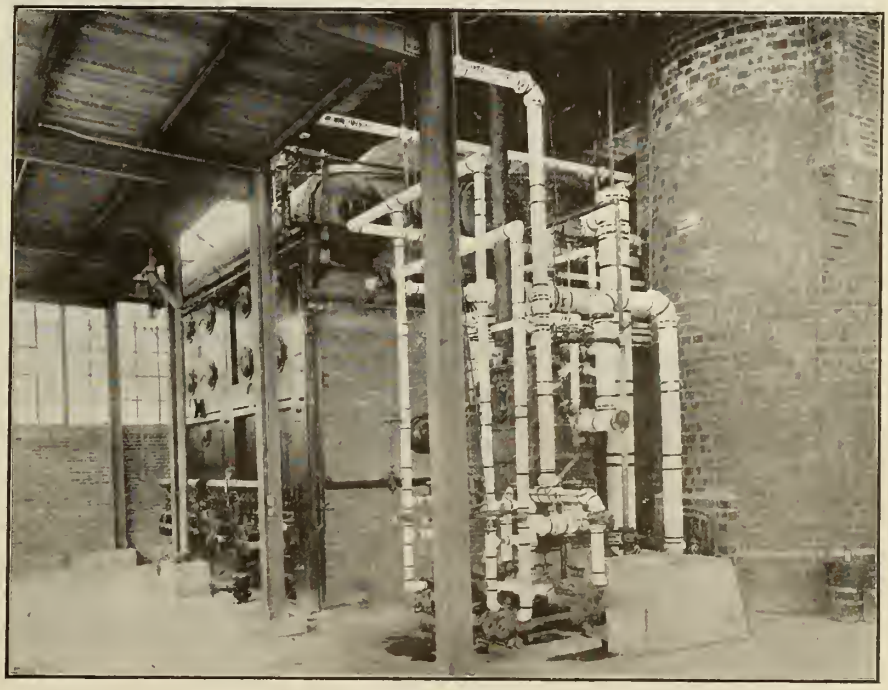
In each shop is installed a heating apparatus consisting of a "Sturtevant" fan, engine and heating coils and guaranteed to maintain a temperature of 70 degrees when the outside temperature is 20 degrees below zero. In the iron finishing shop, the air ducts are carried over the roof trusses and so arranged that the air can be re-circulated through the building. In the foundry and brass finishing shops, the air is not recirculated but drawn fresh from outside continually. In these two shops, ducts from the fan are laid under the floor, with risers at various points about 6 ft. high terminating with a three-branch delivery.

The fan in the iron finishing building is a 120 in. full housing steel fan with single inlet and top horizontal discharge direct connected to a 6 in. x 9 in. steam engine, horizontal type. The pipe coil heater contains 4,445 lineal feet of 1 in. steel pipe on 6 four row heater bases. The sections are arranged for a 3 in., inlet, 2in. drip and 1 in bleeder, and are jacketed top, bottom and two sides with steel plates connected to the inlet of the fan so that the latter draws air over the heater pipes. In the brass finishing building is installed a 7 x 4, ¾ housed steel plate Sturtevant fan having a right hand bottom horizontal discharge, and driven by a 7 in. x 10½ in. horizontal steam engine. A pipe coil heater containing 6,328 lineal feet of 1 in. steel pipe is used and built in seven 4-row sections of heater bases with the same connections as the above fan, and steel plate jacketed on the top, and two sides connected to the inlet of the fan so that air is drawn through the heater by the fan suction. There is a 6 x 3½, ¾ housed fan in the foundry driven by a 6 in. x 8 in. horizontal steam engine. The heater contains 5,162 lineal feet of 1 in. pipe. In other respects this fan is identical with that in the brass finishing building. Eighty pounds steam pressure is supplied to all the fan engines, and the exhaust steam for the heating coils is supplied at two pounds pressure. Pipes to each unit from the power house, are laid in the tunnel.

General Features.

Although the company only started manufacturing in June, considerable progress has been made, and the plant now is in good working order. The original plans called for a much larger plant than exists at present but additional buildings will be added from time to time as the expansion of the business makes it imperative. In the layout of the plant provision has been made so that future extensions will not interfere with the present system.

The officers of the company are Oscar B. Mueller, President, C. G. Heiby, Vice-President and Superintendent, Adolph Mueller, Treasurer and F. L. Riggin, Secretary.



ENGINE ROOM SHOWING ROBB FORCED LUBRICATION TYPE ENGINE.

CANADA STEEL CO., HAMILTON, ONT.

THE plant of the Canada Steel Co., Hamilton, was almost demolished by fire during August, and by November was reconstructed. Opportunity was taken to extend the plant. The new building is of steel and absolutely fireproof. Adjacent to it is a machine shop of concrete and steel construction.

The Cana la Steel Co. was incorporated in 1911 for the manufacture of rail-carbon steel. The output consists of flats, rods, squares, angles, reinforcing bars, and specialties in bar steel and iron, rolled from selected old steel rails. The rails are broken into suitable lengths, and are pushed into the furnace by an electrically operated ram, the feed being continuous. When the rails have reached the proper heat, they are taken out and passed through the rolls. The head of the rail is separated from the web and flange, and is rolled into rounds, squares and flats, while the others are converted into shapes. The furnace and rolling mill were not much damaged in the recent fire, and are still in service.

A new furnace and mill recently installed are to be used specially for irregular stock, which cannot be used in the other mill. It is a four-side, sand bottom furnace, 45 ft. long, with cast iron shell, lined with firebrick, the odds and ends about the plant being fed in at the side doors, and not continuously. In the larger furnace the rails are pushed in continuously at the coolest end of the furnace. After reaching the desired

GAS FIRED "STIRLING" WATER TUBE BOILERS, FEED WATER HEATER AND PUMPS.

heat, the stock is withdrawn from the sides, and carried up through 12-inch Belgian roughing rolls, and passed on to the 8-inch finishing rolls, where it is brought down to final size. This mill has been specially designed to manufacture small channels—¾, ⅞, inch, etc., and small T bars, angles, squares and rounds, from ¼ to ¾ inches. From the rolls the stock is carried to the hot beds and straightening beds, then to the shears and weighing machine, and eventually to the cars. The roughing and finishing mills were supplied by the United Engineering and Foundry Co., Pittsburg, and were erected on foundations fourteen feet deep.

Ahead of the old rolling mill the Steel Company have installed an 8-inch train of rolls, consisting of a set of pinions, one three-high, and one two-high set of rolls, to be used whenever a section being finished on the web is holding back the rest of the mill, or, in other words, when the other two bars in the mill are being finished quicker, and one is waiting for the web bar to be finished. These have been supplied by the same concern as the above.

MACHINE SHOP INTERIOR, CANADA STEEL CO., HAMILTON.

Power Plant.

Following the fire, it was found necessary to build a new power house, and to instal a new motor and driving equipment for the big rolling mill. Power is supplied by a 1,000 h.p. Canadian Westinghouse motor, taking current from the Dominion Power and Transmission Co., at 2,200 volts, 60 cycles. The power is transmitted to the rolls by means of a continuous rope, two-thirds of a mile long, and a flywheel weighing 20 tons, direct connected to the mill. The tension is taken up by a pulley on a traveling carriage, controlled by weights.

The power house is built of brick and concrete, and measures 25 x 60 ft. The driving equipment was supplied by the Dodge Manufacturing Co., Toronto, who will also supply the equipment for another power house being erected at the other end of the mill. This will contain a 1,000 h.p. C. G. E. motor, using Hydro-Electric current, connected by rope with a 20-ton flywheel, so that if anything goes wrong with either the other will run both mills. A 5-ton Shaw electric crane was installed this fall for handling all finished product, and a special set of power shears to handle stock from the new mill has been built and supplied by the John Bertram & Sons Co., Dundas.

At the east end of the plant a store room has been built, with racks for storing steel bars. This is equipped with stock shears and a punch for punching cross arm braces and angle straighteners. This addition is served by an independent track, used solely for shipping material from stock. A pattern-making shop has also been erected for making patterns for guides and miscellaneous pieces around the plant. Half this building is used as a general storehouse.

The Machine Shop.

The line shafting is one of the features of the new machine shop, which has been erected a short distance south of the main plant. This was designed by the master mechanic, William Armstrong. Angles were bolted to the pillars, to which were bolted two I beams. The hangers are clamped to the I beams, and can be moved in any direction to suit the pulleys.

Much of the equipment used in the old shop has been saved, including two roll lathes. Another has recently been supplied by the United Engineering & Foundry Co., Pittsburg. Among other new equipment is a large radial drill supplied by the Mueller Machine Tool Co., Cincinnati, O.; a drill by the Sibley Machine Tool Co., South Bend, Ind.; a 12-inch lathe, made by the John Bertram & Sons Co.; a Butler shaper, power hack saw, grinders, etc. New machine tools will be purchased next year, including lathes, planer, 24-inch shaper, and grinders.

A furnace, made by the Dominion Radiator Co., Toronto, was installed this winter to heat this section. It will provide heat for a building twice the size, provision being made for extending the machine shop later. A blacksmith shop has been erected at the western end of this building. There is also an office for the master mechanic, and a draughting room in which all the tools and rolls are designed. The machine shop is of reinforced concrete, with steel frame, the steel throughout all the buildings being supplied by the Canada Steel Co. themselves. The floor is of concrete, except where the roll lathes are situated. Here it is covered with creosoted blocks, as chilled rolls are easily chipped.

William M. Currie is vice-president and general manager, and Alfred Oran, superintendent.

BOILER EXPLOSIONS.

By H. T. Westwood.

BOILER explosions are becoming almost as common at automobile accidents. The latter have now ceased to excite more than a passing interest, and the average individual, on reading an account of one, usually dismisses it from his mind with the chance remark—Well, if they will take the risks, they must also take the consequences.

Of Public Interest.

The public, however, cannot afford to regard boiler explosions in a similar light. It is a question of vital importance not only to the engineer and fireman, but to the public at large, involving the personal safety of everyone employed in a building in which a steam boiler is in service, as well as of those who happen to be in the immediate vicinity. When one stops to consider that nearly every large building in Canada is equipped with one or more boilers upon whose safe operation hang the lives of scores of persons, the gravity of the situation is apparent.

The recent explosion at the saw mill of Manly Chew, Midland, Ont., described in a recent issue of Canadian Machinery, strongly emphasizes two points: First, the necessity of having all parts of the boiler accessible for inspection; second, the necessity of rigid inspection. Failure to comply with the former requirements, however, is no excuse for laxity of the latter.

We should have Government boiler in-

spectors practical men, and the best that can be found would not be too good to fill the position.

If any part of the boiler is inaccessible it should be the duty of the inspector to demand that the owners provide means for its inspection, and furthermore, he should have the power to withhold the certificate until satisfied that the boiler may be safely operated under the particular operating conditions. Engineers, firemen, boiler makers and inspectors are interested in this matter. They live, move and have their being around steam boilers, and explosions touch them deeper than any one else.

A Criticism.

Being one of the craft, may I not examine and question the verdict of the jury in the Midland case?

Two men killed, and their death was accidental.

What caused the explosion?

Here was a boiler with a double riveted lap jointed longitudinal seam, a construction condemned by all experts for reasons that have been explained in Power journals many times. The seams were of lap jointed double riveted construction with the flexure common to that design.

If the plate be weakest, cracks occur. If the rivet section in shear be weakest, then the bending action long continued will result in shearing at mid-section, and granting failure at that point, it follows that the remaining rivets being weaker than the net plate give way by shearing.

In view of the above the verdict of the Midland jury may be set aside as of no value to the men operating steam boilers. The explosion points out again the danger of operating boilers of this construction. No examination short of a water test with the wall removed to permit the seams being examined is of any real value on boilers of this design, and this test should he supplemented by trams over the seams and by steel tape around the circumference of the shell at several points.

That about two boilers explode every day in the United States, and those in Canada becoming more frequent is by no means credible to those supplying us with reservoirs for stored energy.

FOUNDRYMEN IN THE MAKING.

AT a recent meeting of the Lancashire Branch of the British Foundrymen's Association, Mr. W. H. Sherburn —a former secretary of the Association —read a paper on "The Making of a Foundryman." He dealt first with the necessity for apprenticeship, which subject, he said, was now attracting much attention, although hitherto no satisfactory system had been evolved. Technical schools and technical literature had multiplied enormously during the last thirty years, but the training of apprentices was never in a more unsatisfactory state than at present. The matter was vital to the future of the workers.

The craft of the foundryman was second to none in the scope which it offered for capacity of the highest order, and if it had been regarded in the past as only an inferior branch of engineering, this was through bad management and the lack of self-respect of those engaged in the work. There had, however, always been a few worthy craftsmen who had upheld the dignity of the craft and realized its importance. To many people, however, the craft of iron-founding was still a "dirty job," to be got away from as soon as possible. Iron was just iron; sand was sand (or mere dirt), and coke was just fuel; and if only the casting "passed" and was paid for, there was an end of it. It was for them, the Associated Foundrymen, to alter all this and to raise their craft to the position and dignity which was its due.

He suggested an earlier discrimination hy those in charge of elementary education of the natural bent and inclination of the children. He thought that more flexibility must be allowed to the teacher, the training of the young proceeding in an even orderly way without any sudden break. The higher standards should give place to an arrangement into groups —mechanical, commercial, or artistic, according to the observations of the teachers during the earlier periods of education. Such a method would facilitate the drafting of boys into industrial life, and greatly reduce that large class of boys who on leaving school did not know what they would like to be put to. In the days of the early Trade Guilds the boy worked and lived in his master's home and imbibed his spirit.

The Half-Timer Feature.

After the lad left school, he thought that the first year of industrial life should be that of a half-timer, to give opportunity for attendance at technical classes. The practical side of the foundryman's craft was much better learned under actual conditions in the workshop, given, of course, competent craftsmen in charge. The remainder of the training, he suggested, should be performed on the following lines.

Two years in the moulding shop under a competent workman—not to be his lahorer, but to wait on him and learn the practical use of the tools and materials. The workman should, in fact, be a temporary father to the lad. The practice of drawing must in the meantime be kept up by the pupil, this being of the utmost importance.

If the boy showed an aptitude for drawings and designing, he should spend a year in the pattern shop learning the tools and their uses and the nature of his materials — wood, clay, plaster of Paris and lead. Ater this preliminary time he might be put at the hench under the guidance and control of an experienced workman. In his opinion, it was impossible to design patterns of a satisfactory form, unless the designer had practical and technical knowledge of moulding. Mutual understanding and frequent intercourse between the drawing office, the pattern shop, and the moulding shop were essential to good work.—Ex.

INTERNAL COMBUSTION LOCOMOTIVES.

THE internal combustion locomotive as a factor in main line locomotive practice has now passed the proposal stage, and a number of interesting designs are availahle for consideration, though as yet practical realization is confined to a very few specific instances.

According to the Railway News, a design recently made public includes two internal combustion engines, each driving an axle through clutches, arranged one at the front and one at the rear end symmetrically to a vertical plane through the centre of the locomotive. The axes of the engine cylinders converging upwards towards the central vertical plane, and the driver's stand and water tank are arranged in the centre. The cooling water for the engines is circulated by pumps through coolers arranged one at each end of the locomotive. Each engine is clutched to its axle by a pneumatically operated clutch.

The arrangement, therefore, produces a 2-10-2 design, with cooler and diagonal engine at each end and driver's cab in the centre, the respective engine shafts being between the leading—or trailing axle, and the driving axle next thereto, gearing transmitting power to the five driving axles, which are actuated through the pneumatic clutches mentioned.

Ottawa, Ont.— Tenders addressed to the undersigned and endorsed "Tender for Submarine Cables," will be received at the office of the Department of Public Works, until Thursday the 15th January, for 10 knots of gutta-percha cable with 4 conductors, and 14 knots of gutta-percha cable with 2 conductors, to be delivered at Halifax, N.S., or St. John, N.B., by the 1st of May, R. C. Desrochers, Secretary.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

REMOVING, REPLACING AND BEADING BOILER TUBES.

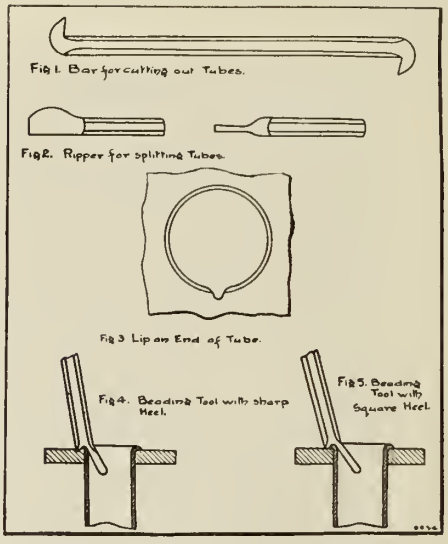
By H. Westwood.

IN a recent issue of Canadian Machinery J. Langridge wished to know "What is the usual procedure in removing, replacing and beading tubes in a return tubular boiler.

The manner of installing tubes does not differ materially with types of boilers. In removing a full set of tubes from a return tubular boiler, a start should be made from the bottom, being the tubes nearest the hand hole. The tube in the front head is cut off with a bar as shown in Fig. 1 while the bead is cut off the tube in the rear end with a hammer and flat chisel. The tube is then worked down and out of the hand hole in the front head.

In case one or just a few tubes are to be taken out the front end is usually split and the bead cut off on the back head. Then, by means of a sledge and special tool, the tube is knocked out of the tube sheet and removed. The ripper shown in Fig. 2 is used in splitting the tube, after which a slit is cut, extending back beyond the tube sheet an inch or two. This allows the tube to be closed in and removed through its own hole.

Scale Trouble.



If scale adheres to the tubes to the extent that they cannot readily be removed in this manner then they must be removthrough the hand hole. Should the latter not be in a convenient place, the hole in the tube sheet may be enlarged and the tube extracted through it. For this purpose it is necessary usually to enlarge the hole from ⅛ to 3-16 of an inch, depending upon the amount of scale adhering. It should not, however, be enlarged more than necessary, as it must be reduced to nearly normal size when the new tube is put in. In some cases, especially with the locomotive type of boiler a copper ferrule is placed between the tubes and the sheets. This however, usually applies only to the sheets directly in contact with the flames and hot gases, although some manufacturers use a copper ferrule in both tube sheets.

The replacing of tubes in an old tube sheet must be done with the utmost care. The sheets should be carefully inspected and all scale removed from the inside surface around the hole. The edges of the holes should be chamfered leaving a good fillet to prevent the tube from being cut by sharp edges or burrs. Again, the holes are liable to be out of round, in which case they must be reamed.

In some types of boilers there is a marked tendency for the fire box sheets to expand more in a vertical than in a horizontal direction. This distorts the hole, the vertical diameter being slightly greater than the horizontal diameter. The holes at the centre of the tube sheet usually suffer most from this distortion.

Installing a Set of Tubes.

Before installing a set of tubes, attention should be given to the sheets to see if they are straight, and if not they should be straightened as far as possible. This is accomplished by means of bars and bolts. When the sheet has been straightened, a number of tubes, depending upon the size of the boiler, are temporarily fastened to both sheets to permit the removal of the straightening bars, after which the balance of the tubes can be inserted and the operation completed.

REMOVING, REPLACING AND BEADING BOILER TUBES.

It is general practice, with tubes which are beaded at one end and the other end expanded only to cut them the desired length before inserting into the tube sheets. Some times there is more or less variation in the lengths of the tubes in which case the tube sheet is divided into sections, the tubes of each section being cut the same length. They are then marked for their respective sections, and when installed all will project from the sheet about the same distance.

If the tubes are to be beaded at both ends, then the measurements should be taken with more care, and the variation between the sections should not exceed 1-16 of an inch. Some boiler manufacturers design their boilers so as to use a special length of tube. All the tubes are usually about the right length and those that project too far beyond the sheets are cut off at the desired point by a special machine, although frequently a flat chisel and hammer is used. Tubes expanded into the sheet and not headed should not extend beyond the sheet over 3-16 of an inch. Those which extend too far beyond the sheets not only prevent proper expansion but also permit the surplus part of the tube, which is not cooled by the water, to be burned or wasted away.

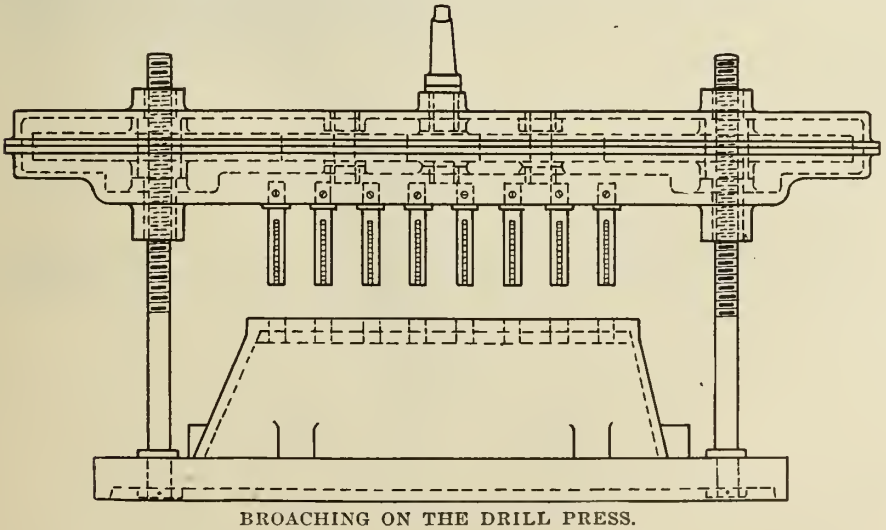
The Rolling Feature.

Tubes are tightened into the sheets by means of a roller or sectional expander. When the tube is inserted into the hole it should project beyond the sheets 3-16 to ¼ of an inch, which amount is allowed for the bead. The tube is held temporarily by lipping the tube with a hammer as indicated in Fig. 3. The lip will hold the tube in position while it is being expanded. Usually about four turns of the expander will force the tube out against the sheet. The use of a heavy maul for driving the mandril should be discouraged, as the blows struck upon the mandril should not be heavy enough to cause the tube sheet to warp or spring.

The tubes ought to be worked to the sheet, and if this is done properly the sheet will not be distorted. A large tapering pin should never be used to enlarge the tube. The copper ferrules are annealed before being put into place and must be a neat fit. If too small for the hole, they may be stretched and reannealed. In expanding tubes with the roller expander, the mandril should be forced in only a short distance at a time, otherwise humps will form and make the rolling unsatisfactory.

In rolling leaky tubes, expand them very lightly and use an ordinary hammer on the mandril. It is not well to remember that heavy pounding is not required to tighten the tube in the sheet, as the tube has already the full contour of the expander. Beading the tube is very important. A beading tool constructed with a sharp heel is very liable to result in the sheet being cut when the bead is calked. In Fig. 4 is shown a

beading tool having a sharp heel, also the manner in which it cuts the sheet, while Fig. 5 shows a beading tool with a square heel which prevents the cutting tendency.



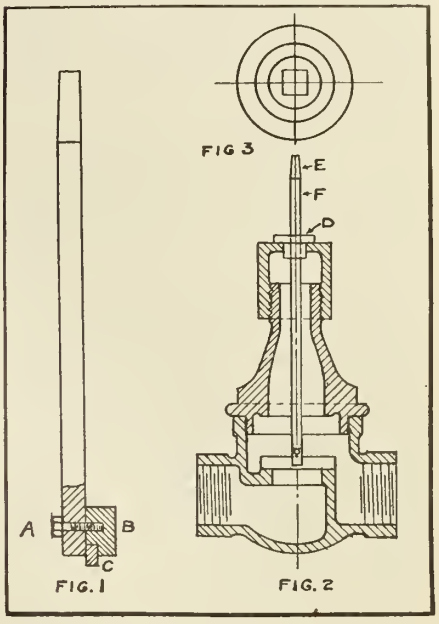
BROACHING ON THE DRILL PRESS.

By D. S. Mann.

ANYONE who possesses a good, first-class drill press now considers that he has a complete machine shop, and perhaps rightly so. The writer has used drill presses for all kinds of work from boring cylinders to cutting key-seats, yet he recently ran onto an operation in an automobile factory which was new to him, and will probably be to many readers. The job was on the upper half of an automobile engine crank-case. The push rod bearing guides were provided with keys to prevent their turning in the case, and the job in question was broaching the eight holes for these guides. The cases were of aluminum, and were laid on the base of the fixture shown and centered by means of dowels in holes which had previously been drilled. The fixture as shown was simply set on the drill press table, a tapered shank being provided for driving the mechanism. The drill press was provided with a tapping attachment so that the broaches could be quickly run out, and this was probably the main reason for using on the press.

Of course, the fixture could have been driven by a separate attachment and been complete in itself, but the way it turned out the work was a sight worth seeing, and was, therefore, used only a portion of the time. Five gears comprise the driving mechanism, the centre pinion being integral with the tapered shank, and driving through the two idlers the larger gears at the ends, which are provided with bronze nuts in the centre, fitting the vertical screws. The casing itself is fitted with bronze bushings above and below these nuts, sufficiently long to properly guide the arrangement. As the centre pinion is revolved, the outer nuts travel up or down according to the direction desired. The main point to be noticed in the whole arrangement is that there is no thrust on the spindle of the press, all the stresses being self-contained. The broaches are held in the bottom of the frame by set screws, and have shoulders to take the thrust, also having keys to line up the cutting edges in the proper position.

There was need to clamp the work but lightly, as the cutting was all done directly downwards, the only upward pull being on withdrawing the broaches. The fixture, in comparison to the work being done and the time saved over any other method was remarkably simple, and at the same time cheap and sensible. It only goes to show one more use for our old friend the drill press, and in the near future we will not be surprised in the least to hear of some firm starting in the automobile game with only a few drill presses.



BROACHING ON THE DRILL PRESS.

A JENKINS VALVE RESEATER.

By J. E. N.

SOME years ago I made a tool to reseat Jenkins style valves, and Figs. 1, 2, and 3, show it. The square iron rod (F) can be tapered slightly at the top if required, and for valves up to 2 inches diameter, a ⅜ inch rod is big enough as this size rod will fit nicely into a breast drill. A 3-16 in. or ¼ in. in. bolt (A) holds the clamp (B) in place, and the latter can be made from a piece of iron ⅜ x ½ inch. This clamp holds in place a piece of file (C).

To use the apparatus, remove the bonnet and valve stem, then remove the stem from the bonnet and place the rod and file in its place and screw on the bonnet again. As the stems in different sized valves arre not the same in diameter it will be necessary to get a few small bushings (D), made. By placing the tool as shown and giving it a few turns with a brace or breast drill, a new face will be ground on the valve seat,

JENKINS VALVE RESEATER.

and if absolute smoothness is desired, remove the file, after turning the new seat, and place a short piece of tool steel in its place. A few turns with this latter on the filed seat will make it absolutely smooth.

It is obvious that different lengths of file and steel will be required for different sized valves. This tool costs only a very small sum of money in any case, to make or even get made, and it will positively make a true and smooth seat on valves from 1¼ inch up to 2½ inch with only a few minutes work. The valve can be repaired without removing it from the pipe, but care should be used to see that all brass filings are washed out before replacing the stem and disc.

BOILER SHELL FORMULA QUERY.

By John J. Grancis.

IN a recent issue of Canadian Machinery there appeared a very clear and concise report by T. J. Main on the recent boiler explosion at Collingwood, Ont. I shall be glad, however, to have an explanation concerning the fraction .69 appearing in the numerator of the formula there given, and meantime presume that his calculation is based on the following general and universally accepted formula for arriving at the working pressure of steam boiler shells:—

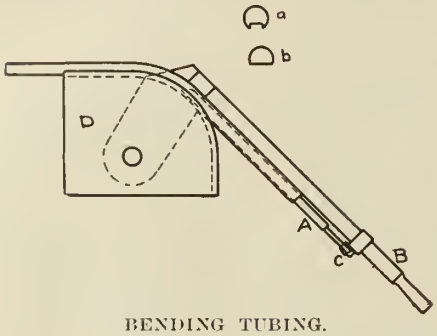
$$W.P. = \frac{TS \times t \times E}{R \times F}$$

where (TS) = tensile strength and (t) the thickness of the shell plate, (E) the

lowest efficiency of shell plate and rivets at the longitudinal seam, (R) the radius of the boiler shell, and (F) the factor of safety. If (E) or .69 in Mr. Main's formula is the lowest efficiency of shell plate or rivets at the longitudinal seam, what is the tensile strength of the plate and the shearing strength of the rivets allowed by him?

Editorial Explanation.

It is quite evident from Mr. Main's formula in both instances that 60,000 pounds per sq. inch has been taken as the ultimate tensile strength of the shell plate, and his idea in using it on the second occasion, with a much reduced shell plate thickness and most certainly bereft of more or less of its original strength, even if it did happen to have been 60,000 pounds per sq. inch when new, is intended to demonstrate more clearly that, even under such circumstances, 25 pounds per sq. inch working pressure was the limit of the boiler instead of 80 pounds—the pressure carried, when it blew up.



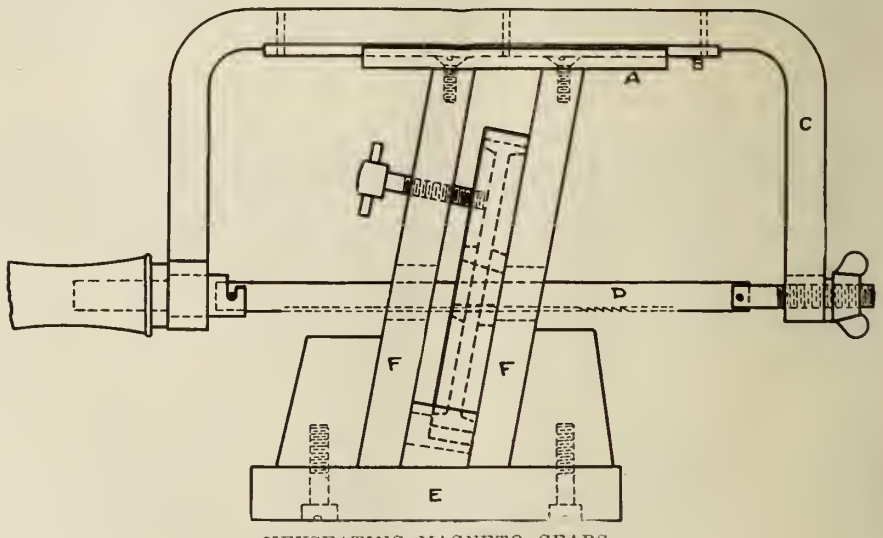
Regarding the shearing strength of the rivets, we have no doubt Mr. Main reckoned this at from 82 to 85 per cent. of the tensile strength of the plate, and although it does not appear to be definitely stated in the article covering the report, the longitudinal shell seam must have been of the double riveted lap type, at least. The omission to note the type of joint in the report naturally induces speculation relative to the fraction .69 in the formula, especially as one would gather from the data generally that the joint was only single riveted lap, and would have, as a consequence, a rivet section value of but .56.

In a succeeding issue we will endeavor to have Mr. Main indicate the type joint and make whatever additional observations he cares to.

BENDING TUBING.

By D. S. Mann.

THE following arrangement was used in putting the right angle bends in the tubing used for the outer frame of automobile wind shields. The section of the tubing is shown at (a), although the method is adaptable to any shape, either round or special. The block (D) was bolted to the table and had a circular groove around the edge. The lever (B) was operated by hand and the rod (A) first slipped into the tubing, and held at (C) by a slot in the clamp. A section through the rod (A) is shown at (b). The inner end of this rod was rounded off just at the beginning, or rather the ending of the bend, looking at it from that end. This end just followed the curvature as the lever (B) was brought around. All the actual bending took place, however, over the end of this rod, and deformation was absent due to its shape. Of course, for any special piece there would of necessity be some few trials to determine the exact length of



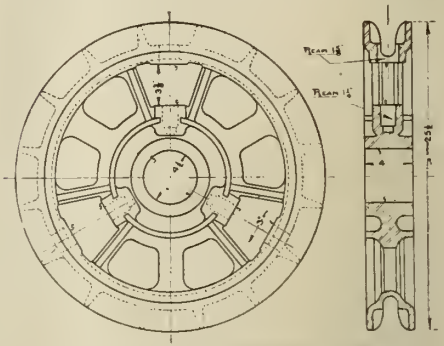
BENDING TUBING.

the inner rod. The job done on this fixture was perfect as far as could be seen, and there was no delay, as the rod fitted in the tubing rather loosely and the two shoulders at (C) held it in the same relative position at all times to the lever (B). Anyone who has had pipes or steel tubing to bend can appreciate the difficulties experienced, and is advised to try this method.

KEYSEATING MAGNETO GEARS.

By D. O. Barrett.

STANDARD magneto shafts for automobile use are provided with tapered ends, keyseated, and with a nut for holding the driving gears on shaft. The keyseating of these gears is an annoying job, due to the steep taper and the small size of the hole. The drawing shows the method we pursued in handling the job. The base (E) is clamped in a vise, the gear slipped in at the side between the pieces (F F), and resting in a V-block, being held solid by means of a clamping screw. The steel piece (A) at the top was grooved to correspond to the sliding steel piece (B) riveted to the hacksaw frame. The saw (D) was of the same width as the keyseat, and was guided by slots in the pieces (F F). The proper depth was obtained when (B) was resting full on (A). This job was handled by one of the apprentices, and the keyseats were cut in a surprisingly short time. These keyseats were approximately 1-16 inch square.



KEYSEATING MAGNETO GEARS.

DRILL PRESS BORING JOB.

D. O. Barrett.

THE drawing shows a sheave wheel used on a gasoline driven traction engine. A chain drive is used, the chain being of the round link variety or better known as log chain. The material is a steel casting, and the sheave is arranged

DRILL PRESS BORING JOB.

to carry three bevel pinions which revolve on pins held stationary in the sheave. These pinions mesh with gears on either side and form the differential.

The centre hole was first bored and faced on a lathe, and the boring of the holes and the facing done on the drill press as shown in the photograph. The various tools are shown on the table. The casting holding the sheave on the press table carries an indexing fixture with three positions and corresponding clamps. A stop is provided for one of the arms as shown at the left of the upper bushing, and a set screw at the bot-

tom forces over another arm to keep in proper contact. The three outer clamps are arranged with slots so as to be readily removable.

The holes in the casting were all cored and were exceedingly hard on the first drill, due to the large amount of sand on the surface. A long slip bushing was provided at the top reaching as far as possible into the groove. It will be noticed that two of the holes cut into the teeth on either side which made these particularly hard to start.

The tool second from the left shows the type first used. These were shells fluted helically and driven by a pin in a slot. It was found, however, that, in starting the holes where the tools would cut into the teeth at the sides, either these driving pins would be sheared off or else the cutters would be split. Four fluted drills with straight cutting teeth were then adopted as shown and proved

DRILL PRESS BORING JOB.

very satisfactory. The drills were of high-speed steel inserted in casehardened shanks, pinned and the whole arrangement ground. These gave no trouble and were thereafter used on all jobs of a similar nature. Two cuts were taken and the holes then reamed with an ordinary shell reamer. For the bottom hole a bushing was inserted in the holding fixture and an ordinary drill first run down, these holes not going entirely through. It was then finished as before.

In facing, the hardened bar fitted both of the previously finished holes. The first facer was provided with a serrated edge for breaking up the scale, and the surfaces were then finished with a flat tool. This job was a particularly hard one to handle owing both to the material and the shape of the piece, and had formerly been done outside, but the tools shown produced these accurately and no trouble was experienced with any of them. The total time for the drill press operations was about forty-five minutes, somewhat less than the time in which they had been done outside on a different type of machine.

WOODS FOR MAKING PATTERNS.

IN an investigation with a view to determining the relative merits of the different woods employed for pattern-making purposes, it was discovered that three kinds are chiefly employed—white pine, cherry and mahogany. White pine has always been used primarily in the manufacture of patterns, and still furnishes the principal supply of material for this purpose. Owing to the high price of number one shop and better white pine, which are the grades employed for patternmaking, California sugar pine is substituted to a considerable extent in patternmaking shops where large castings are made.

Sugar pine is regarded as the best substitute existing for white pine, but is not as satisfactory, for the reason that the tiny "sugar streaks" in this wood are prone to ooze resin, even through the varnish finish, which often results in a rough casting. However, by the employment of a heavy coat of varnish, this deficiency of the wood is not difficult to eliminate. While both white pine and sugar pine are inferior to cherry and mahogany, their lower price makes them more generally employed for patternmaking purposes. It has been estimated that patterns made in cherry and mahogany can be used several thousand times, whereas a softwood pattern would endure only about one quarter as long a period.

Constant use will wear off the sharp edges that are all-important in the forming of an accurate mold. When this occurs the usual remedy is to chamfer down the blunted corners and set in duplicates of cherry or mahogany. In core-boxes, it is a common practice to glue a hardwood veneer over the pine. Small or delicate patterns liable to be subjected to unusual wear are always made of hard-woods. The larger patterns, such as gear wheels, have their teeth made of hardwood, and the framework of pine.

Generally speaking, any wood that tends to either shrink or swell is poor material for patternmaking. Experience has shown that pine will shrink considerably in width, and will also expand materially when placed in contact with the moist core sand. This latter objection, however, has largely been overcome by varnishing.—Hardwood Record.

C.P.R. CONSTRUCTION.

A TOTAL of 1,700 miles of railway has been under construction during this season by the C.P.R., according to statements made by J. G. Sullivan, chief engineer of the western lines of the company, who has returned to Winnipeg from an extended tour of the work being undertaken. The amount of material which has been handled by the construction department of the company has been more than was moved during any period in the building of the Panama Canal, and represents no less than 30,000,000 cubic yards.

WOOD-USING INDUSTRIES.

ACCORDING to a bulletin obtainable from the Forestry Branch, Ottawa, 807,456,000 feet, board measure, of wood were used by thirty-eight different industries in the manufacture of all sorts of finished products, from spools to ships. The value of the wood so used, as purchased in the rough, represented a total of $19,161,384, and the capital engaged in these industries (which do not include sawmills, etc.), together with the labor engaged in the manufacture of these finished products, represents a very important economic asset to the resources of the Province of Ontario.

Thirty-four different kinds of wood were used, chief of which was pine, representing 21.7 per cent. of the total, and costing, on the average, $25.60 per thousand feet, board measure. Good, clear, white pine, however, is becoming comparatively scarce, and it is being increasingly substituted by spruce, which costs little more than half as much, being one of the cheapest woods on the market. It is significant to note that only six native species were purchased entirely within the Province, considerably over $5,000,000 being paid for imported wood.

The bulletin contains forty-three tables, containing summarized and detailed information regarding the quantity, value, kind, and source of supply of the woods used in each industry. Short descriptions of each species, with a list of their uses, are also included and suggestions are made as to the utilization of waste, while the appendix contains a classified directory of all the manufacturers.

The Dominion Iron & Steel Co. are filling an order for upwards of 15,000 tons of reinforced rods for the Welland Canal, which will keep the hands in that department busy for weeks to come. They expect to receive a big order for reinforced concrete material from the firm of Foley Bros., Welch & Stewart, who were recently awarded large contracts in connection with the Government railway and deep water terminals under construction at Halifax.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same, direct reliable answers. Catch questions will be avoided. The knowledge of simple addition, subtraction, multiplication and division of decimals, will be found a most useful companion study, and should not be overlooked.

Question.—The driving pulley on a shaft is 42 in. diameter and makes 20 revolutions per minute. How many revolutions per minute will the driven pulley make if its diameter is 3 ft.?

Answer.—Multiply the diameter of the driving pulley by its revolutions per minute, and divide the result by the diameter of the driven pulley. The pulley diameters must be both taken as feet or inches. Example:

$$\frac{42\times20}{36} \text{ or } \frac{42\times20}{12\times3} = 23.33 \text{ R. P. M.}$$

• • •

Question.—The wheels of a bicycle are 28 inches in diameter. The sprocket wheel connected with the pedals has 18 sprockets; the one connected with the wheel has 8 sprockets. How many miles an hour does the rider make if the pedals revolve 120 times to a minute?

Answer.—Multiply the pedal revolutions per minute by 60 to get revolutions per hour; multiply this result by the number of teeth in the pedal sprocket wheel and by the circumference in inches of the rear running wheel; then divide by the number of teeth on the sprocket attached to the latter and by 63360 the number of inches in a mile. Thus:

$$\frac{120\times60\times18\times28\times3.1416}{8\times63360} = 22.49 \text{ miles}$$

per hour.

• • •

Question.—A gear has 25 teeth and its diametral pitch is 16. What is its pitch diameter?

Answer.—The pitch diameter is found by multiplying 3.1416 by 25 and dividing the result by the diametral pitch 16 and by 3.1416, thus: $\frac{3.1416\times25}{16\times3.1416} = 1.5625$ inches pitch circle diameter.

The circular pitch is found by dividing 3.1416 by the diametral pitch 16, thus $\frac{3.1416}{16} = .19635$ inches circular pitch.

It will be noted that this last formula accounts for the first figures on the upper and lower lines of the first formula. The figure 25 on same formula is the number of teeth given; this multiplied by the circular pitch found, makes the pitch circle circumference. The divisor 3.1416 is used to bring the pitch circle circumference to pitch circle diameter.

Question.—The diameter of a piece that is being turned is 2 in. If the piece makes 2,500 revolutions per minute, what is the cutting speed?

Answer.—Cutting speed is always rated and spoken of in terms of feet per minute, therefore as the piece is being turned in amount equal to the length of its circumference, that length in feet wants to be first known.

$\frac{2\times3.1416}{12} = .5236$ feet per revolution.

$2500\times.5236 = 1309$ ft. per minute, or $\frac{2\times3.1416\times2500}{12} = 1309$ ft. per minute cutting speed.

• • •

Question.—The milling machine counter-shaft pulleys driven from a line shaft are 14 inches in diameter and are to run 100, 200 and 150 r.p.m. respectively. Find the diameters of pulleys for the line shaft running at 200 r.p.m.

Answer. $\frac{14\times100}{200} = 7$ inches diameter.

$\frac{14\times200}{200} = 14$ inches diameter

$\frac{14\times150}{200} = 10\frac{1}{2}$ inches diameter of line shaft pulleys respectively.

• • •

Question.—How many revolutions per minute ought a piece of cast iron, 3 inches in diameter be allowed to make if the cutting speed is usually 40 feet per minute?

Answer.—Bring the cutting speed to inches by multiplying 40×12 which will give 480. This divided by 3×3.1416, the circumference of 3 inch diameter, will give 50.9 revolutions per minute.

$\frac{40\times12}{3\times3.1416} = 50.9$. By keeping the cutting speed in feet, the statement of the formula to get the same result would be

$40\div\frac{3\times3.1416}{12} = 50.9$ r.p.m.

• • •

Question.—A certain grindstone will stand a surface or rim speed of 800 ft. per minute. At how many r.p.m. could it be run if its diameter were 4 ft. 8 in.?

Answer.—Divide 800 by the circumference in feet of the 4 feet 8 inches diameter grindstone.

$\frac{800}{4.66\times3.1416} = 54.6$ r.p.m.

• • •

Question.—In a double butt strap joint, the outer butt strap is usually made narrower than the inner. Give the reason why?

Answer.—It assures a good caulking edge on the outer strap, free from liability to "spring" between the rivets, which are close pitched.

• • •

Question.—From what part of the joint do we reckon the strength of plate left between rivet holes, in a treble riveted double butt strap joint?

Answer.—From between rivet holes on the outer and widest pitch longitudinally.

• • •

Question.—What is meant by single and double shear, as applied to rivets?

Answer.—Single shear means that the rivet has only got to cut or shear through once before the joint gives out. Double shear means that the rivet has got to cut or shear through twice before the joint gives out.

• • •

Question.—Give an example of single shear rivets and double shear rivets.

Answer.—The rivets in a lap joint are in a single shear. Those in a double butt strap joint are in double shear, in all cases of their passing through both butt straps. Where the outer butt strap is narrower than the inner, the outer row of rivets is in single shear, because they pass through the shell and inner strap only.

• • •

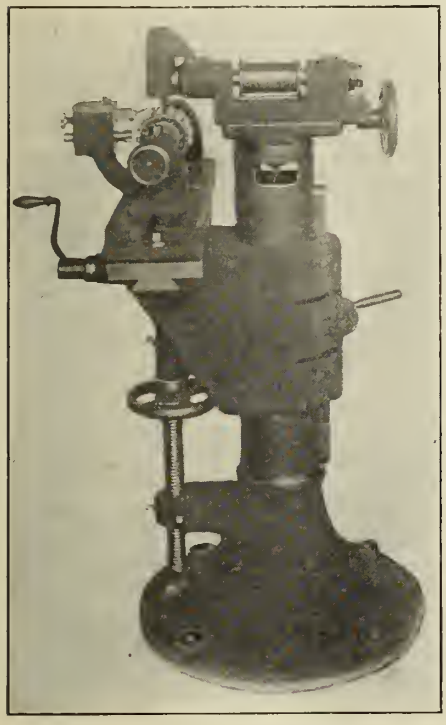
Question.—Calculate what horse-power may be safely transmitted by a 16-inch double leather belt running on an engine fly-wheel 14 feet in diameter, and making 80 revolutions per minute.

Answer.—A safe working stress for single leather belting is 45 pounds per inch of width, and for double belting 75 pounds per inch of width. The horse-power transmitted will be the total stress on the driving side of belt multiplied by the velocity of belt in feet per minute and divided by 33,000.

Total stress is $75\times16 = 1200$ pounds.

Velocity of belt is $3.1416\times14\times80 = 3518.6$ feet per minute.

Horse power transmitted is



$$\frac{1200\times3518.6}{33{,}000} = 128, \text{ nearly.}$$

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

HOB AND CUTTER GRINDER.

THE machine which we briefly describe and illustrate was designed especially for sharpening hobs and radially relieved cutters. It is provided with a knee capable of vertical adjustment, with a swivelling table on same, also for adjustment where angular

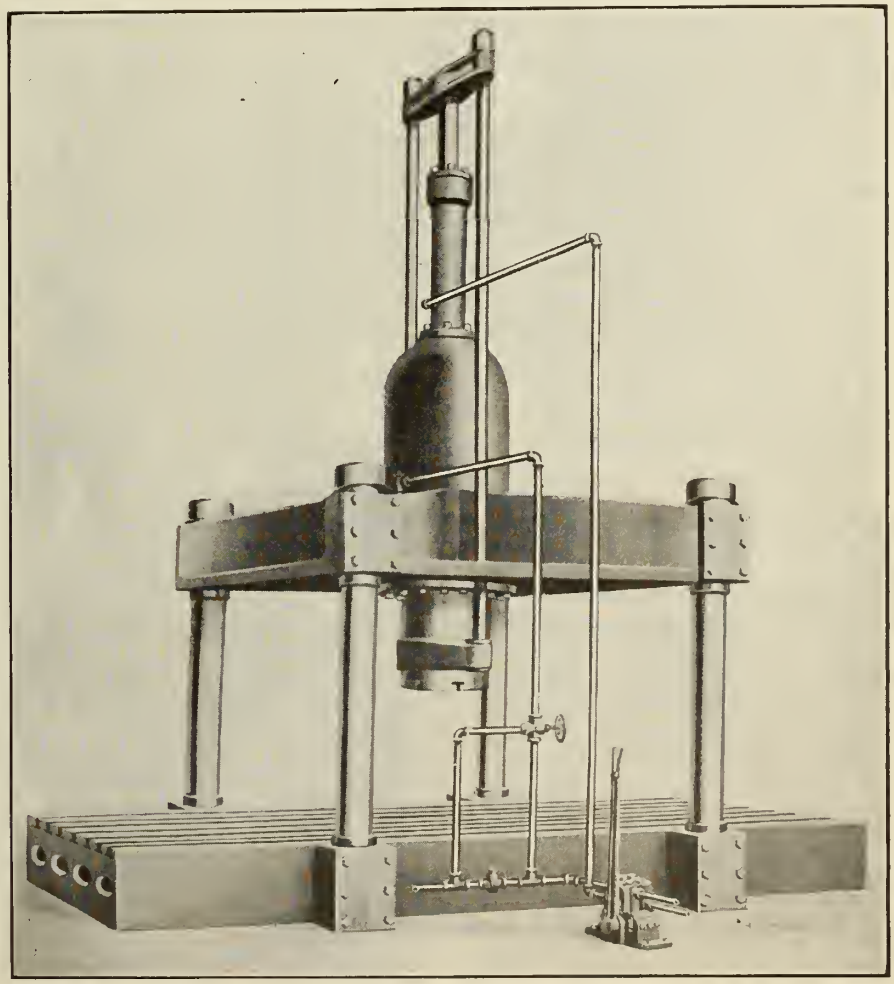
HOB AND CUTTER GRINDER.

grinding is necessary, and is equipped with a rigid and substantial arm for holding an indexing finger furnished with screw adjustment.

The wheel is mounted on the spindle in a cross slide, which has adjustment for different diameters of work. The maximum capacity of this grinder is as follows:—Swing, 8 in.; length on centre, 13 in.; travel, 12. The total weight is approximately 700 pounds.

The Lees-Bradner Co., Cleveland, Ohio, are the builders of this hob and cutter grinder.

500 TON INVERTED HYDRAULIC PRESS.

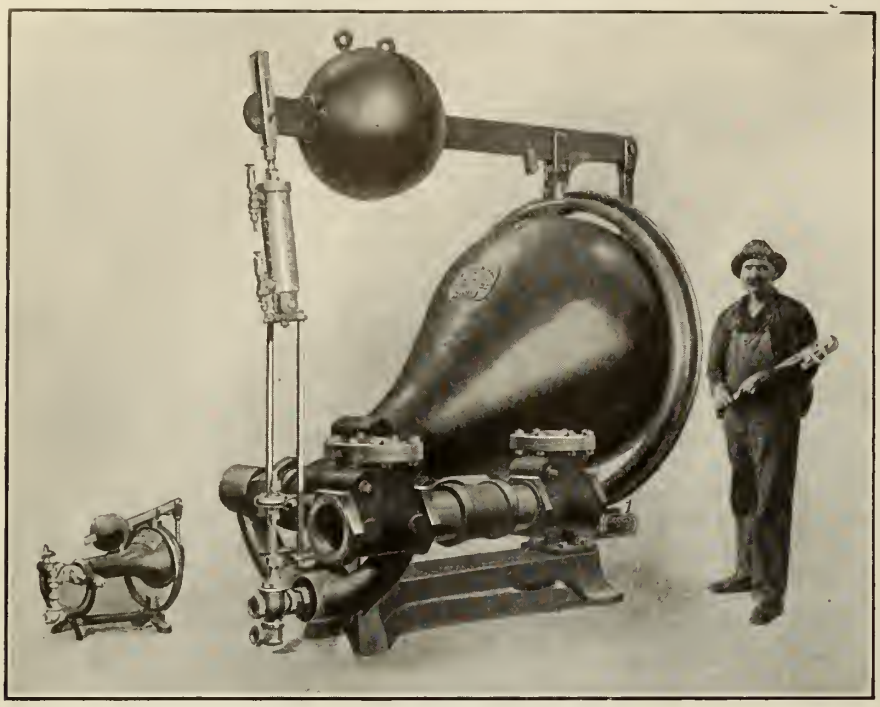


THE press illustrated was primarily designed for foundry use in the straightening of steel castings, but it can be used for other heavy straightening work, such as is often necessary in large industrial plants. The press was designed and built by the Hydraulic Press Mfg. Co., Mount Gilead, Ohio.

The machine is hydraulically operated, and is capable of producing high degree pressure with great accuracy and speed. By opening a valve, the ram by its own weight drops to the work. This action causes the hydraulic cylinder to fill from the surge tank, and, therefore, the action of the pump obtains high pressure quickly, as the pump services are not required to fill the cylinder. When the stock has been straightened, the pressure ram is returned to any predetermined point of its run by the action of the pump pressure working through a return ram operated in an auxiliary or pull-back cylinder.

By merely shifting the lever of a double acting operating valve the pressure is applied to either the pressure ram or return ram, and permits the fluid to return to the surge tank. This surge tank is also used as a pump reservoir. As soon as the pressure ram has returned high enough to admit the work, the valve lever may be thrown into a neutral position, which holds the ram stationary until the operator is ready to apply the pressure. This method of operating saves a needless movement of the ram in both directions, thus economizing on time, labor, power and saving the wear on packings.

The working capacity of this press is 500 tons. The pressure bed is 6 feet wide and 12½ feet long, while the daylight or working space is 40 inches. The ram has a diameter of 20 inches, with a run of 24 inches.



The press is built strong and rigid, and is capable of giving long and hard service, steel being used in its construction throughout. The strain rods are 5½ inches in diameter, and are made of forged steel. The pressure ram is faced with an open hearth steel plate, which has tee slots, to which pressure blocks may be attached for various requirements.

500 TON INVERTED HYDRAULIC PRESS.

THE LARGEST STEAM TRAP IN CANADA.

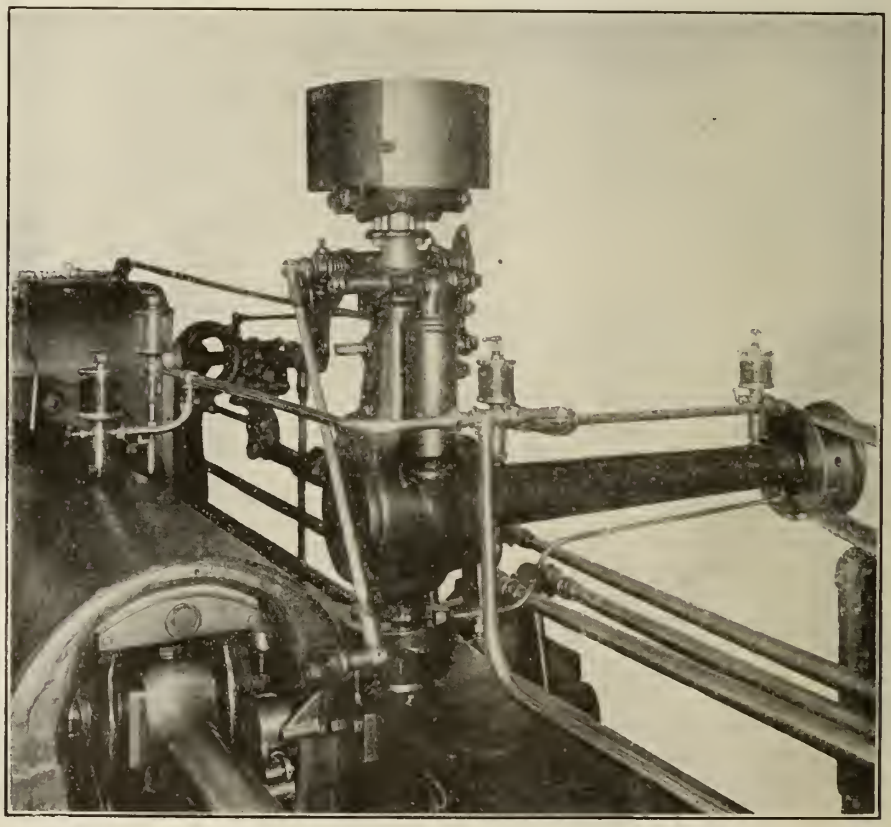
THE illustration herewith shows the largest steam trap that has yet been installed in Canada. This huge

THE LARGEST STEAM TRAP IN CANADA.

Bundy trap was recently suuplied by H. L. Peiler & Co., Montreal, to the Quebec and St. Maurice Industrial Co. at La Tuque, P.Q.

All the high pressure drips in this large pulp plant are returned to a closed receiver, and then go back to the boiler through the return trap. The trap has 4-inch inlet and outlet connections, and returns 50,000 lbs. of water per hour to the boilers, handling nearly half a ton of water at each operation.

The shipping weight was 3,200 lbs, and the trap stands 6 ft. 6 in. in height. In spite of the great weight, the adjustment of the dash pot is so sensitive that the valve closes with absolutely no jar.



RICE AND SARGENT ENGINE STOP MOTION.

THE stop motion described in this article is from the designs of Mr. J. W. Sargent, Providence, R.I., and the sale of the apparatus is controlled in Canada by the International Engineering Works, Ltd., Amherst, N.S. The arrangement, as its name implies, is a safety device usually attached to the governor so that, when the engine exceeds a certain speed, the valve gear will be moved to approach zero cut off position.

The Sargent stop motion is operated by an inertia weight carried on the engine crosshead. Normally, this weight is held back against the stop by an adjustable spring, and remains quiet in relation to the crosshead, but when the engine exceeds about 5 or 10 per cent. of the normal speed, the inertia of the weight overcomes the spring at the end of the engine stroke, causing the weight to move forward from the crosshead about $\frac{3}{8}$ of an inch and strike a hammer blow against a lever pivoted to the bed plate. This blow releases a latch and allows the valve gear to be moved up by a spring to zero cut off position, corresponding to the highest travel of the governor. No attention is required when shutting down the engine or when starting it up, and the full movement of the governor weights is available for useful work. The apparatus may be tested at any time when the load is off the engine by pulling down on the levers to speed the engine up to the limit.

When it is desired to use push-buttons for stopping the engine from distant points, a separate electrical attachment is used whereby a weight falls and strikes a blow on the latch mechanism to release it. This stop motion may also be used in connection with the throttle valve to release a latch or toggle, and allow the valve to close promptly. When so used, the stop weight is on the other end of the crosshead and operates at the head end of the stroke.

The York Manufacturing Co., York, Pa., have recently made the following installations in Canada:—Manitoba Club, Winnipeg, one 4-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete: R. H. Williams & Son, Ltd., Regina, Sask., one 2-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete, also congealing tanks and direct expansion piping for storage tanks; Prince George Hotel, Toronto, ont., one 11-ton vertical single-acting steam driven enclosed type refrigerating machine and high pressure side complete.

STOP MOTION LATCH ENGAGED; VALVE GEAR READY TO START UP.

PRATT & LETCHWORTH, BRANTFORD, ONT.

THE Pratt & Letchworth Co., Ltd., Brantford, Ont., makers of malleable iron castings, have considerably extended their large foundry this year, and installed much new equipment. This was necessitated by a fire which on April 7 demolished an addition which had only been made during the previous fall. As the plant was fully insured, the extension was rapidly replaced, and operations began again in June. The plant output is now 3,000 tons per month, which is an increase of 100 per cent.

Among the most important additions to the plant were a 250 x 175 ft. extension to the foundry at the west end, and a three-storey fireproof pattern storage building. The latter is a brick building, standing along north of the main building. One storey is used as a patternmaking and carpenter shop. There is also located in this building a chemists' laboratory for testing products and raw materials. An addition was also made to the shipping room, and preparations are being made for a machine shop, for which much of the equipment has already been purchased. A sprinkler system is being installed throughout the plant for fire protection.

Annealing Ovens.

To cope with the ever-increasing business which this firm enjoys, the equipment has recently been augmented at a cost of several thousand dollars. Six annealing ovens of the muffler type have been built by the firm themselves. These are used for annealing large castings, and differ from other ovens in that no pots are used for holding the product. When muffler ovens are used, the fire does not come in direct contact with the castings, as is the case on the pot ovens, consequently, the castings are easier to cool. and the type of oven is better suited to the work in every respect. The firm now operate twelve ovens of the muffler type, and ten pot ovens.

A considerable portion of the work secured by the Pratt & Letchworth Co. is for railway companies, car works, and agricultural implement firms, and is of a heavy description. Consideable small work is also done, the annealing for this being done in the pot ovens. A complete system of pyrometers has been installed on all ovens by the Price Electric Co., Buffalo, for regulating the heat.

Melting Furnaces.

Three new 20-ton melting furnaces of the firm's own manufacture have been installed in the new section of the foundry, and in convenient proximity to other new equipment. The charging of these is made easy by electric cranes, which travel the whole length of the foundry. The plant now contains seven furnaces, two of 15 tons and five of 20 tons capacity.

To make the plant more up-to-date and to facilitate work, a new craneway, running the whole length of the building, has been built by the Dominion Bridge Co., Montreal. On this operate two 5-ton electric cranes, supplied by the Whiting Foundry Equipment Co., Harvey, Ill.

The equipment for cleaning castings is not housed in one room, but is distributed throughout the building, the tumblers varying in size according to the size of casting turned out. Three batteries of new tumblers have been installed this year, which brings this equipment up to twelve large tumblers and twelve small ones. These were installed by the W. W. Sly Mfg. Co., Cleveland, O., who also had charge of the dust arrester system which has been connected to the tumblers throughout the building.

Other recent installations include a large Ingersoll-Rand air compressor of the Imperial type, which supplies air to the large number of moulding machines used in this plant, and to other equipment operated by air. Three blowers, made by Sheldon's, Limited, Galt, have been installed, two supplying the extra blast required for the new melting furnaces.

In the shipping room, an interesting addition is a conveyor leading from the floor to a platform on a level with the freight cars. This will carry a man with a wheelbarrow full of castings, and is a most efficient piece of machinery. The Company have also purchased an electric truck from the Canadian Auto Transportation Co., Welland, Ont., which conveys castings from the foundry to the shipping room.

A wooden coal trestle, with a capacity of 3,000 tons, has been built this year. Coal for the foundry is pushed up the incline in freight cars and unloaded.

Several new electric motors made by the Canadian General Electric Co. have been purchased for use on blowers, etc. Power for all motors is secured from the Western Counties Electric Co. The new machine shop now being built will be used for general repair work, and for making any new machinery required.

Paul J. Vernon, formerly with the International Harvester Co., Deering Works, Chicago, is superintendent of the plant.

—⚙—

Calgary, Alta.—The proposed municipal abattoir will cost approximately $125,000, of which the Dominion Government will provide $20,000 to $25,000.

NICKEL PLATING BRASS AND COPPER PARTS.

THE following formula for "nickel-plating" brass and copper parts is said to have proved very satisfactory. In using this method, the first step is to see that the parts to be plated are quite clean and free from grease. The work is then dipped in a saturated solution of bichloride of mercury, of else a paste is applied by rubbing. This treatment causes a film of mercury to be deposited on the work, and when this result has been obtained the pieces are dried in sawdust and then lacquered in the usual way. If a paste is found more convenient to use than the solution, it may be prepared by adding water to the bichloride of mercury to obtain the required consistency.

It is essential that the parts be lacquered after they have been plated in this way; otherwise the mercury will wear off in a short time. Bichloride of mercury may be prepared by allowing metallic mercury to dissolve in hydrochloric acid until the strength of the acid is used up. The liquid is then boiled off, leaving white crystals of bichloride of mercury in the vessel. Either a glass or earthenware vessel should be used to prepare the bichloride of mercury, as hydrochloric acid will act upon any metal vessel which may be used.

—⚙—

CRYSTALLISING PROPERTIES OF ELECTRO-DEPOSITED IRON.

IN a paper read before the Manchester Literary and Philosophical Society recently, on the "Crystallising Properties of Electro-deposited Iron," Professor H. C. H. Carpenter said that sheets of the metal, which were almost chemically pure, showed remarkable recrystallisation effects when heated and cooled above or below certain temperatures at which a molecular change takes place. In this way relatively enormous crystals are obtained in three seconds when a strip is cooled below a certain critical point.

The same heat treatment which produces coarse crystals in electric-deposited iron has the effect of refining wrought iron and very mild steel, provided they have been rendered coarsely crystalline by close annealing between 700 deg. and 800 deg. Cent. On the other hand, annealing at these temperatures has no effect in coarsening the structure of electrolytic iron refined by mechanical means at the ordinary temperature. In these respects, accordingly, the behavior of the latter is the precise opposite to that of wrought iron and mild steel. Professor Carpenter said that these observations were not only new as regards iron, but were unknown amongst metals of any kind.

INDUSTRIAL NOTABILITIES--No. 15

THOSE who have played against Graham Drinkwater at hockey, or have struggled with him in a business way, agree that he plays the game, but strenuously. That is probably why he is so popular in Montreal and wherever he is known, and a man would have to "go some" to keep up with him. He has recently been appointed vice-president and general sales manager of the Canadian Fairbanks-Morse Co., Ltd. It seems only a short time since he was studying science at McGill.

It is strange how some men can go whole-heartedly into sport, and yet come out top in the industrial world. Although Mr. Drinkwater's duties as general sales manager of this big organization are onerous, he still retains his connection with hockey, being a trustee of the Stanley Cup, the emblem of Canadian hockey supremacy. In his younger days, when a student at McGill University, he played for four years with the Victorias, and in two of these years won the hockey championship. He was also a footballer while at McGill.

Regarding his younger days we know little, except that he was born in Montreal, the son of Charles Drinkwater, for many years secretary of the Canadian Pacific Railway. In course of time he was sent to McGill, and graduated in mechanical engineering in

GRAHAM DRINKWATER.

1897. The following year he took a post-graduate course at the same university, in electricity and testing of materials, and in 1899 started out on his business career. The story of how he ended up with the Canadian Fairbanks-Morse Co. is interesting.

He started in the mining machinery business, working first in the shops of the Ingersoll Sargeant Drill Co., Easton, Pa., then with the James Cooper Mfg. Co., of Montreal, who made the above firm's machinery in Canada. Then followed a trip west to Rossland, B.C., as a salesman, returning in 1901 to take up the position of assistant superintendent in the factory of the James Cooper Mfg. Co.

In 1902 he was back in the States with the Rand Drill Co., but returned in 1903 to join the selling staff of the Canada Foundry Co., Toronto, remaining with that firm until 1905. It was in the following year that the Canadian Fairbanks Co. took him into the scale and railway department, and appointed him general manager of the Montreal office, in January, 1909. Two years later, the selling organization and Toronto factory were consolidated under the name of the Canadian Fairbanks-Morse Co., Ltd., and of this concern Mr. Drinkwater was elected vice-president and general sales manager in 1913. His friends predict greater things for him.

A NEW YEAR'S RESOLUTION.

MOST people resolve on New Year's Day to be different. If a man drinks too much whisky, on that day he resolves to cut it out. He may not succeed, but the attempt probably does him good. Manufacturers have been resolving lately not to buy stock until the first of the year. That may be good, too. It is hoped by other manufacturers that they will make another resolution to-day—that they are going to do better business this year than last, and begin to lay in supplies necessary for same. People who are convinced that they are going to have poor business, get in no supplies, and make no effort to secure it, will have their hopes fulfilled. The general feeling is that business will begin to-day on the upward curve. The chart has shown some sharp downward zig-zags this year. Prices, especially of steel, have done the same. Dealers tell us they have gone as low as they possibly can, and that the rise should take place early this month. Pessimists recommend a total suspension of business just because they believe business is bad. The optimist is the manufacturer who believes business is going to be good again this Spring, and is holding his men to cope with it. He is the man who will save the situation.

ANOTHER BIG CIVIC BUNGLE.

ON Saturday last, the intake pipe of the Montreal city waterworks broke, and for several days over half a million people have been without water, except for what was supplied by a private company. During this period, the citizens are being subjected to considerable inconvenience and suffering, especially in institutions like hospitals, where it was found impossible to heat the building because there was no water. In the middle of this trouble, a fire broke out in the central part of the city which was large enough to defy the firemen armed with extinguishers. Eventually it assumed such large proportions, the fire chief considered the advisability of confining it to one block by dynamiting the buildings around. A line of hose, a mile long, was, however, run to the river, and the fire got under control. A quarter of a million dollars damage was done to several manufacturing plants.

There was another serious side to this unfortunate mishap. Water, which is not valued at its true worth until it gets scarce, was absolutely necessary for the operation of certain industrial plants. On Monday morning, seven thousand employees of the Angus Shops of the C. P. R. were ordered to return home, as it was found impossible to run without water. Other large engineering works found difficulty in running, which goes to show how dependent is the mechanic for his daily bread on the men whom he elects to the City Council or the Board of Control.

There has been so much bungling in connection with the running of large Canadian cities within the past few years that the question of who shall govern the city has become a very serious one. Most of the conspicuous mistakes made in recent years have been in connection with waterworks, and in three important instances, with intake pipes, viz., at Toronto, Ottawa and Montreal. The layman is secure when dealing with petty by-laws, but when it comes to a big engineering problem like the water supply the people should see that a man who understands the business runs that department, uninfluenced.

Montreal once laughed at the idea of engaging expert advice on the waterworks. The experts will be called in now.

For the firm who can go ahead with the erection of their plant without resorting to the banks for funds, the present is an excellent opportunity. The price of brick and steel is as low as it has been for several years; labor is cheaper, and there is plenty of it. Another factor of importance is that deliveries are prompt, whereas eight months ago, plants were delayed several months in some cases, for want of steel.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON.

	Mont'l.	Tor'to.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Dec. 29, 1913.—The natural quietness generally found in business circles at this time of the year has been increased this week by a very serious breakdown in the city water supply. At 5 p.m. on Christmas Day a rupture occurred in the main intake pipe about a mile from the low-level pumping station. As there is only the one intake, the result of the accident was a total stoppage of the supply. The high level reservoir is divided into two sections, one of which was empty at the time. Consequently the shortage of water during the past four days has been extremely serious. Fortunately, there have been no bad fires, but two or three small outbreaks have occurred which caused considerable anxiety. The Montreal Water and Power Co., who supply Westmount, Outremont and Maisonneuve, have come to the partial rescue of Montreal, and are supplying about 14,000,000 gallons a day. This, however, is only one-third of the city's normal requirements. Downtown office buildings are for the most part without a drop of water above the second floor, while up-town and in the north end conditions are even worse, householders being supplied from water carts sent out by the City Council. For the most part factories, though greatly inconvenienced, have managed to keep running, except those situated on the higher levels of the city. The Angus shops of the C.P.R. have practically had to close down altogether, the only men now working being those engaged on special jobs. The Company have their own power plant, but owing to the scarcity of water can only generate about 600 horse-power at present. The Point St. Charles shops of the Grand Trunk Railway, being equipped with their own pumping plant, are not affected by the accident. Officials at the City Hall talk of a renewal of the service on December 30 or 31; but this is generally considered to be a highly optimistic estimate.

There has been very little business done in machinery this week, and the same is true of pig iron, steel and other metals. Most firms are busy taking stock.

A Federal charter has just been granted to the Caughnawaga Light, Heat and Power Company, with a capital of $50,000, and headquarters in the Village of Caughnawaga, near Montreal.

The general powers of an electric light and power company are granted to the concern, of which the provisional directors are Frank M. Jacobs and Jacques Curotte, merchants, of Caughnawaga; Paul Theoret, real estate agent; Anselme Deguire, advocate, and Edgar Monette, electrician, Montreal.

Toronto, Ont., Dec. 30, 1913.—To-morrow is the last day of the year, and the next is January 1. Judging from the amount of business that has been deferred until after January 1, that day should see a new lease of life in matters industrial. Price seems to be no inducement to manufacturers to purchase stocks before the new year. Dealers insist that prices cannot go lower, and that now is the time to buy. Mills are closing down rather than sell at lower prices, and production is curtailed from about December 20 to the first week in January. Tenders for finished products are being returned, with repeated demands for lower prices.

Those with rose-colored spectacles are contemplating the material that will be required for Ottawa's big waterworks, tenders for steel to supply which will be called early in February. They point to the Welland Canal, the operations of the Hydro-Electric Commission, who are just preparing for much radial work, and that at Port Stanley. This will tide over the serious part of the winter.

All the steel mills are offering quick shipments—from two to three weeks. They have contracts, but manufacturers are not ready to specify against them. Mill business from Canada is practically nil; warehouse is very fair. No salesmen are out on the road.

Machine Tools.

The Canadian Fairbanks-Morse Co. report about twice as much business for December as for any other two months of the year. The future in machine tools should be better. Manufacturers are realizing that the worst is over, and are looking for an opening up. This does not give better results, but the feeling in the market is much better.

Metals.

Business in metals will certainly not recover until well on in January. Prices remain practically the same. The demand for aluminum is brisk for this time of the year. The demand comes mainly from automobile manufacturers, whereas the wants of electrical concerns are small. The Hydro-Electric Commission should be in the market soon for 400 tons.

WATER FAMINE IN MONTREAL.

A SERIOUS break in Montreal's only intake pipe occurred on the afternoon of Christmas Day, which put the low level pumping station out of commission and resulted in a very serious shortage of water for several days all over the city. The intake is a reinforced concrete horseshoe-shaped pipe, about 9 ft. maximum diameter, and the break, which occurred at a point about a mile from the pumping station, was some 60 feet in length. At the time of writing, repairs are being rushed by the insertion of a steel tube inside the concrete aqueduct at the point of rupture, and it is hoped that pumping will be resumed by January 1. General opinion, however, regards this estimate as extremely optimistic. At the time of the calamity the upper level reservoir was only half full, and but for the help of the Montreal Water and Power Co., who were able to supply about 14,000,000 gallons daily, the city at the end of 24 hours would have been absolutely without water.

Montreal normally uses 42,000,000 gallons each day, and the breakage caused very real inconvenience, espe-

cially in the uptown district. Many people were compelled to get a supply in pails from water carts sent round by the Corporation.

Westmount, Maisonneuve and Outremont obtain their water supply from the Montreal Water and Power Company, and were consequently unaffected.

INDUSTRIAL ACCIDENTS DURING 1912.

THE toll of death from industrial accidents throughout Canada during the year 1912, as shown in a report just published, involved no less than 1,220 workmen, while 5,780 received serious injuries. Thus, 7,000 workers in Canada's industrial army met with fatal or serious accidents while in the discharge of their duty during the twelve months.

Railways and Metal Trades Worst.

An analysis of the record of accidents, as made by the Labor Department, shows that the railway services and the metal trades are by far the most hazardous employments. On Canadian steam railways, 332 employes were killed during the year, and 1,831 were injured, a somewhat startling total. In addition to that there were 152 men killed in railway construction work, and 111 injured. In the metal trades 103 men were killed and 1,326 were injured.

Navigation Comparatively Safe.

Navigation is comparatively a safe calling. The total number of fatalities among those employed in navigation last year was 69, and non-fatal accidents totalled only 62.

In the building trades, the fatal accidents totalled 90, and non-fatal accidents 298. The collapse of scaffolds, etc., a preventible cause, accounted for 71 of the accidents to workmen in the building trades.

Classes of Railway Casualties.

In railway service, collisions caused 55 deaths and 174 non-fatal injuries to railway men. There were 91 killed and 104 injured through being run over by trains or locomotives. Derailments caused 25 deaths and 115 non-fatal accidents.

Dynamite explosions killed 50 men and seriously injured 37 others employed in railway construction, while 19 were killed and 28 injured through falling material.

Public Employees Suffer.

The list of fatalities and serious injuries among public employees indicates that the duty of keeping the peace, fighting fires, etc., is attended with considerable risk of life and limb. Fifteen public employees were killed and 266 seriously injured last year while on duty. Four were fatally shot while making an arrest. One fireman was killed and 31 were injured by being thrown from fire apparatus, and 27 were injured through collisions with street cars, etc. Curiously enough two accidents are put down to "frozen while fighting fires." Street cleaners, who to the casual observer, always seem to be in imminent peril of sudden death, apparently bear charmed lives. In the list of accidents to public employees only two are ascribed to the running down of street cleaners by street cars or vehicles.

The Labor Department does not claim to have secured a complete list of all industrial accidents during the year, but the record is as thorough and accurate as a careful tabulation of press reports and of Provincial Government Statistics will allow.

INTERESTING EXPERIMENTS.

EXPERIMENTS have been carried out to ascertain the danger from electric shock in directing a stream of water on a high-tension electric line. The resistance of a stream of water between the nozzle of a hose and a 12 ft. length of No. 6 copper wire was measured. Energy was obtained from a 250,000-volt 50-kilowatt transformer, with the middle point connected by a low-reading ammeter to earth and one terminal connected to the line. Variations of frequency between 45 and 60 cycles with 20,000 volts showed no appreciable reactance of the stream; resistance was calculated from current and voltage readings. The resistance of the stream rose with increase of water pressure, being slight for 6 ft. to 10 ft. lengths of streams, but marked for 15 ft.

With a 1 1/8 in. nozzle for 5,000 and 30,000 volts, critical lengths of stream were found up to which the resistance had a gradual increase, these being 17 ft. for a 1⅛ in. nozzle, and 20 ft. for a 1½ in. With a stream length of 15 ft. on a 50,000-volt line, a resistance of about 20,000 ohms water path was obtained, giving a current of about 0.25 amp. This would give the holder of the nozzle a severe shock and might be dangerous. With a stream length of 20 ft. for a 1⅛ in. nozzle, or 25 ft. for a 1½ in. nozzle, the resistance was 800,000 ohms. This might be painful but practically not dangerous. The resistance of the body, being relatively low, is neglected.

The fact that a nozzle is earthed through the stream of water in the hose was not found to eliminate danger to the nozzle holder. The resistance of this path from nozzle to earth, through the water in the hose when the latter was thoroughly insulated from earth, was found to be about 150,000 ohms per 100 ft., which could not be depended upon to shunt much of the current from the man holding the nozzle.

SHERBROOKE IRON WORKS, LTD.

THE Sherbrooke Iron Works, Ltd., who have been established since 1887, are among the many firms who have erected new plants during 1913. Well and favorably known during the past quarter of a century as builders of tank work, sawmill machinery, pulp mill and mining machinery, they had during the past few years found their old premises becoming increasingly congested and inconvenient owing to the rapidly growing volume of their business. A new site was therefore purchased in the north-west quarter of the city, and the erection of a modern plant commenced forthwith. The first work from the new shop was turned out in May last. In addition to all their former lines, the firm are now taking up the fabrication of structural steel work and highway bridges, the new plant including a shop especially designed for this class of work.

The new site is served by a private siding into the yard and shops from the C.P.R., and has connections with the Grand Trunk, Quebec Central, and Boston & Maine Railways. On it have been erected two commodious buildings, which accommodate offices, machine shop, blacksmith shop, pattern shop, foundry and structural shop.

The first building measures 140 feet by 95 feet and forms the machine shop. It is divided into the usual three bays and is excellently lighted and equipped. Part of it is partitioned off to form handsome offices for the management and the accounting department, above these being a well appointed drawing office. A portion of one of the side bays is also divided off for use as a pattern shop. In an annex outside the main shop there is a small blacksmith department.

The second building is 220 feet by 95 feet ,and is divided by a transverse partition into two sections. The first of these is 120 feet long and forms the foundry. It is divided into the usual three bays, the main floor being served by a Royce 10-ton travelling crane of the 3-motor type. The foundry is well laid out and has excellent natural lighting.. The second section of this building forms the structural shop. This measures 100 feet by 95 feet, and contains the usual equipment of punches, shears, riveters, etc. Among these there is an all-steel Pells shear.

All the shops are heated by direct radiation and lighted by tungsten lamps.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Guelph, Ont.—A small fire occurred on Dec. 22 in the japanning room of Griffin's foundry.

Edmonton, Alta. — Plans are being made to enlarge the factory of the Winnipeg Ceiling & Roofing Co.

Montreal, Que.— The W. W. Butler Co., Ltd., recently incorporated, adivse that they will not require machine tools.

Goderich, Ont.— The American Road Machine Co. of Canada, Ltd., are not ready to discuss machine tools for their new plant.

Beaverton, Ont.—The machine shop and foundry, which has been operating for forty years, has been closed indefinitely.

Toronto, Ont.—Roden Bros., 99 King West, have awarded contracts to build a plant for the manufacture of jewellry on Wilton Ave.

Montreal, Que.—The Decbul Tools, Ltd., the Auto and Garage Co., and several manufacturing firms were burned out on Monday, December 29. Total loss, $285,000.

Niagara Falls, Ont.—The Dominion Chain Co., Ltd., Ellen Avenue, are negotiating for a site on which to erect a factory for the manufacture of various kinds of chains.

P. L. Robertson Mfg. Co., Milton, Ont.—The amount of business done during 1912 doubled that of 1911, and up to the present the company has a 100 per cent. increase on that of 1912.

Sarnia, Ont.—Plans have been prepared for a two-storey machine shop of brick and steel to be erected by Henry Lougheed, 125 Front Street, who is receiving bids for the building and equipment.

Bedford, Que.—The Corey Needle Co. has sold out to the Excelsior Needle Co. of Torrington. Conn. The Corey Co. employed between 50 and 60 hands. It is understood that the new concern will enlarge the plant.

Midland, Ont.—The Midland Malleable Iron Co., Midland, Ont., has let contract to the Rauff Co., Milwaukee, Wis., for the erection of a concrete and brick foundry building, 83 x 503 ft., one storey, to cost $115,000.

Prince Albert, Sask.—H. C. Struchen, Minneapolis, Minn., has been granted a free site of ten acres on which he will erect a pulp and paper mill. He has been granted 1,500 h.p. from the city's plant at La Colle Falls.

Sarnia, Ont.—The Cleveland Foundry Co. advise that practically the entire equipment for their Sarnia plant will be shipped from Cleveland. No castings will be made at Sarnia, so all the machinery will be of the punch press line.

Quebec, Que.—The American Titanic Iron Co., Ltd., have been incorporated at Ottawa, capital $1,000,000, to manufacture and deal in iron, steel and all other metals. Incorporators: Simon N. Parent, Ottawa; Eugene Roberge, Lambton, Que., etc.

Woodstock, Ont. — The Wayne Oil Tank and Pump Co. are making good progress with their new building. There will be no foundry; merely a sheet metal working department and machine shops. They should be ready to instal machinery in February.

Montreal, Que.— Fraser & Chalmers of Canada, Ltd., have been incorporated at Ottawa, capital $100,000, to carry on business of manufacturers of mining machinery, at Montreal: Incorporators: John J. Creelman, Gilbert S. Stairs, etc., Montreal.

Bedford, Que. — Plans for the new plant of the Bedford Mfg. Co., makers of scythes, axes, etc., who were burned out a month ago, call for four buildings 150 x 50 ft. each, building to commence at once. The town will give a bonus of $12,000.

Sarnia, Oct.—The Sarnia Bridge Co. announces that on January 1 they will commence an extension to their plant, which will mean the increase of their working staff by about 50 men. The addition, which will occupy about seven acres of land, will be erected adjacent to the present plant. Recently the firm increased their capital.

Sarnia, Ont.—The steel work of the new Perfection Stove plant is completed. The steel was fabricated at Cleveland, and shipped here ready to be erected. The roof is being placed in position, and is made up of 2-inch pine sheeting covered with asbestos roofing. The floor will be of concrete, but will be covered with hardwood over its entire surface.

Coaticooke, Que.—The factory of the A. O. Norton Co., makers of lifting jacks, was destroyed by fire on December 28. The loss is considerable, but has not yet been definitely ascertained. It is only partly covered by insurance.

Welland, Ont.—A permit for the new factory building and office of the Electric Steel & Metals Co. was issued by the city engineers department last week. The building will be of concrete, steel and brick, and will cost $30,000. The Standard Steel Construction Co. have the contract.

Electrical

Winchester, Ont. — Hydro-Electric power was turned on Dec. 19.

Goderich, Ont.—The Hydro power was turned on here Sunday last.

Winnipeg, Man.—The Shipman Electric Co. suffered $18,000 loss by fire Dec. 19th.

London, Ont.—The street railway is now taking 1,000 h.p. Hydro power from the city.

Bridgden, Ont.—The village will spend $4,000 on the erection of an electric lighting plant.

Peterboro, Ont.—The city is spending $120,000 on a new power and lighting system.

Souris, Man. — The new civic light and power plant was opened by the Mayor, Saturday, Dec. 20.

Brigden, Ont.—This village will spend $4,000 for the purchase and erection of an electric lighting plant.

Wilkie, Sask. — The town will raise $30,000 for the extension and development of the electric light service.

Owen Sound, Ont.—The Council has decided to light the business section of the town with 100-c.p. tungsten lamps.

Forest, Ont.—The town's first public utility was opened Dec. 23, being the new $20,000 electric light and power plant.

Cobalt, Ont.—The valve house of the Northern Ontario Ontario Power Co. was destroyed by fire Dec. 21. The loss is estimated at $1,000.

Sherbrooke, Que.—Two Miles Falls Water Power Co., has been incorporated with a capital of $500,000. Incorporators:—I. L. Lafleur, J. E. Roberge, O. E. Dorais.

Orangeville, Ont.—The Pine Light & Power Co. are making preparations to serve Dundalk, and are considering an extension to Grand Valley and Arthur, 28 miles distant from its plant.

Havelock, Ont.—At the coming municipal election, Havelock ratepayers will vote on a by-law to authorize the council to purchase a supply of electric power from the Hydro-Electric Commission.

Fort Francis, Ont.—Plans are underway for the development of the water-power situated north-east of the town, to furnishing hydro-electric power for the use of industries at a very low rate.

Stouffville, Ont.—On January 6 ratepayers will vote on a by-law to take over the electric light plant lately operated by Jonas Byer, and now by John Bartholomew, and for reconstructing the system.

Toronto, Ont.—The following towns in Ontario will vote on Hydro-Electric by-laws: — Strathroy, Kemptville, Havelock, Wallaceburg, Creemore, Sandwich, Tilbury, Chatham, Hanover, Williamsburg, Winchester Springs, and a group taking power from Eugenia Falls.

Edmonton, Alta. — The power plant superintendent is asking for an expenditure of nearly half a million dollars for new machinery and extensions to the plant. The following are his estimates for 1914: $614,000 for the general operation of the plant, and $210,000 for interest and sinking funds.

Wood-Working

Parry Sound, Ont. — The Thompson Boat Works was destroyed by fire Dec. 23rd.

Englehart, Ont.—West & Jackson will make an addition to their sawmill in the spring.

Trenton, Ont.—The Canada Creosoting Co., will go ahead with the construction of new buildings.

Richmond, Que.—S. E. Desmarais & Co.'s saw and grist mill was destroyed by fire December 23.

Watford, Ont.—The factory known as the Hastings Wagon Works has been permanently closed. The building has been taken over by Silverwoods, Ltd., of London, and is being remodeled, under the managership of L. R. Kennell, as an up-to-date creamery plant.

Goderich, Ont.—E. Bachelor has written the council stating that he intended to erect a factory for wood working purposes. He asks for a bonus.

Fort Francis, Ont.—The Fort Francis Sash and Door Factory will be considerably extended this year, in order to handle increased business.

Moose Jaw, Sask.—The T. G. Brown Co. have agreed to erect a sash and door factory 50x80 feet., two storeys. costing $10,000, and $6,000 for machinery. It will be ready Oct. 1, 1914.

Brantford, Ont.—The Brantford Piano Case Co., Ltd., have built foundations for a new plant. The directors are: M. S. Phelks, W. D. Schultz and Jos. Ruddy. This plant is 200 x 48 feet. main building, two stories, white brick. There will be a separate power house 36 x 86 feet, containing 180 h.p. high pressure boilers, and 150 h.p. engines, with all necessary equipment. The company will manufacture piano cases and back, trusses, pilasters, music cabinets, phonograph cabinets, piano benches, and high grade veneer stock.

General Industrial

Loveborn, Sask.—All the machinery in the newspaper plant was destroyed by fire last week. Mr. Hill, owner.

St. Mary's Ont.—The Thames Quarry Co., will erect a plant for the manufacture of cement, stone and brick.

Quebec, Que.— Touriguy & Marois, whose shoe plant was destroyed by fire recently. will rebuild either in Quebec or elsewhere.

Perth, Ont. — Fire destroyed the Scotch Line cheese and butter factory Dec. 21, causing a loss of $5,000. with $1,000 insurance.

Winnipeg, Man.— Plans have been prepared for rebuilding the malt house of the Canada Malting Co. The structure will be one storey, of brick.

Vancouver, B.C.—The Carhart Manufacturing Co., of Detroit, will establish a factory in Vancouver for the production of overalls, etc.

Sarnia, Ont.—The Stewart Jam Co. is considering an extension to the present accommodation, the improvements to cost about $15,000.

Sydney, N.S.—A group of local men have completed plans and estimates for the erection of a flour mill to be established on the old mill site on Anderson's point. The news is confirmed by H. C. Burchell of the Cement Co., who is interested in the venture.

Port Arthur, Ont. — T. H. Shields, West Hamilton, Ont., is contemplating the erection of a pottery here, if the clay in the district proves satisfactory.

Fort William, Ont.— The new plant of the Fort William Starch Works, Ltd., on Island No. 2, costing $300,000 is closed in, and should be operating by February.

Guelph, Ont.— An American concern has made the city a cash offer for the Morlock factory which will be used for manufacturing. Another concern will erect a $100,000 factory here.

Moose Jaw, Sask.—The city has executed an agreement with the Stewart Sheaf Loader Co., of Winnipeg, under which the Company agrees to build a warehouse to employ 20 men, next summer.

Berlin, Ont.— The bark mill, leach houses, tanning department, boiler house and tannery offices of the Breithaupt Tanning Co. were totally destroyed by fire Dec. 22. The plant will be rebuilt at once.

Bridgeburg, Ont.— L. A. Woodward, local manager of the Genesee Pure Food Co. has been appointed by his firm, the headquarters of which are in LeRoy, N.Y., to select a desirable location for a plant here.

Grand Forks, B.C.—The Grand Forks Canning Co. held their first annual meeting last week, and elected C. A. Wallace, president and managing director. Machinery for the new plant will be ordered immediately.

Vancouver, B.C.— A reorganization of the Ocean Falls Co. in amalgamation of Pacific Coast paper interests, will put the Ocean Falls pulp plant in active operation again, and in addition mean the building of a $3,000,000 paper mill.

Petrolea, Ont.—The Canadian Oil Refining Co. is building a new wax works. Several skilled mechanics have been brought from the United States to instal the machinery. It is estimated that the cost of the plant will be about $75,000.

Brantford, Ont. — The A. J. Reach Mfg. are putting up a very modern plant in Brantford to manufacture sporting goods. The A. J. Spaulding Co. have leased a building in Brantford for a year with the privilege of renewing, for manufacturing sporting goods.

Estevan, Sask.—A Mr. Welk was recently here looking at a site for a flour mill of 250 barreds capacity. He will require a site 250 x 120, for which he is prepared to pay a reasonable price, and will require concessions in the way of electric power.

Quebec, Que.—A syndicate, in which Col. B. A. Scott is interested, will erect a $4,000,000 pulp and paper mill, with power plant on the Saguenay River.

Vancouver, B.C.— Charles S. Meek, acting for the Royal Crown Soap Co. has purchased 66 feet on the corner of East Hastings and Carleton streets, which the Company will utilize in the building of a warehouse. Work on the construction of the soap factory in North Burnaby will proceed in a short time.

Sarnia, Ont.—It is reported that the new plant being erected here by the Imperial Oil Co. is for the manufacture of a new motor spirit. Excavations have begun for a battery of nine stills of 250 barrels' capacity each. Additional buildings will be put up for the purifying of the fuel, including condensers, agitators, sweeting stills, etc.

Building Notes

Vancouver, B.C.—The contract for new service wing and nurses' home for the General Hospital has been let to Booker, Campbell & Whipple, the amount of the contract being $199,921.

Regina, Sask.—The Consolidated Rubber Company will erect a $40,000 warehouse, 100 feet wide by 113 long, half to be left one storey high for the present, but the whole building to be set on a foundation to carry one of the best warehouses in the city.

Contracts Awarded

Milton, Ont. — The P. L. Robertson Mfg. Co. have received contracts for screws, etc., from several of the largest carriage, furniture and auto factories during the past few weeks, which will keep the factory working full time for the next eight months.

Toronto, Ont.—Acting on a principle of "City work for City men," the Board of Control has accepted a tender for the supply of cast iron pipes from Jan. 1 to Dec. 31 from a local firm in preference to a lower one from the Florence Iron Works of Philadelphia, Pa. The estimated cost will be in the neighborhood of $100,000, while the American foundry would provide the supply at a price cheaper by $2,400.

Calgary, Alta.—The City of Calgary, is meeting a great demand for space in the industrial building which it is proposed to erect in the near future. The plan calls for the erection of a modern factory building of eight or ten storeys, space in which is to be leased to small industries just establishing here. The new structure will contain every facility for the small manufacturer. Calgary is now becoming quite an important industrial city, and a number of small industries employing from ten to fifty hands are ready to begin operations as soon as the municipal factory building is completed. Many of the smaller manufacturers have not enough capital to undertake construction on their own account, and it is hoped the policy proposed will have the eventual effect of building up a large number of fine industries. The proposal originated with the Calgary Industrial Bureau, but has now been taken up enthusiastically by the city council. It is expected that a by-law for the appropriation of the sum required will be placed before the electors for their endorsement in the early future.

New Incorporations

New Ontario Pressed Brick Co., Ltd., incorporated at Toronto, capital $150,000, to manufacture building materials of all kinds, at Sudbury, Ont. Incorporators: Chester A. Durkee, Isaiah Proctor, etc., Sudbury.

Construction Supply Co., Ltd., incorporated at Toronto, capital $60,000, to carry on the business of general contractors and engineers, at Toronto. Incorporators: William Bain, Joseph Ellis, etc., Toronto.

The Dart Cycle Car Co., Ltd., incorporated at Toronto, capital $100,000, to manufacture, assemble, buy and sell cycle cars and power driven vehicles and parts thereof, at Toronto. Incorporators: Harry B. Smith, Frank M. Lorsh, etc. Toronto.

The Renfrew Molybdenum Mines, Ltd. incorporated at Toronto, capital $1,500,000, to acquire, own, lease and dig for ores, metals, and minerals, at Mount St. Patrick, Renfrew, Ont. Incorporators: Stanley T. Chown, John Geale, etc., Renfrew.

The Non-Nitro Explosives Co., Ltd., incorporated at Toronto, capital $180,000, to manufacture explosives, and the by-products thereof, at Toronto. Incorporators: Joseph J. Flint, Henry A. Hall, etc., Toronto.

The National Vending Machine Co., Ltd., incorporated at Toronto, capital $100,000, to manufacture, purchase or otherwise acquire and deal in vending machines, etc., at Toronto. Incorporators: Mark V. Packard, St. Louis, Mo.; Blanche C. Boyd, etc., Toronto.

Russell Jennings Mfg. Co., Ltd., incorporated at Ottawa, capital $50,000, to manufacture and deal in augers, auger bits, and all kinds of machinery, at St. Catharines, Ont. Incorporators: Arthur L. Jennings, Chester, Conn.; James K. Kernahan, etc., St. Catharines.

The Canadian Mantel and Refrigerator Co., Ltd., incorporated at Toronto, capital $100,000, to manufacture and deal in grates, mantels and refrigerators, at Hamilton. Incorporators: Henry D. Petrie, Henry G. Ogg, Wilfred W. Currier, etc., Hamilton.

Beaver Coal & Power Co., Ltd., incorporated at Ottawa, capital $1,000,000, to acquire mines, sell and deal in briquettes, coke, oil, shale, creosote, sulphate of ammonia, and all other metals, at Montreal, Que. Incorporators: Frederick H. Markey, Waldo W. Skinner, etc., Montreal.

The Connolly-Agnew Construction Co., incorporated at Toronto, capital $40,000, to engage in and carry on the business of contractors for the construction and installation of waterwork plants and systems at Toronto. Incorporators: John F. Connolly, Thomas C. Agnew, etc., Toronto.

The Caughnawaga Light, Heat and Power Co., Ltd., incorporated at Ottawa, capital $50,000, to carry on the business of an Electric Light Company in all its branches and to manufacture, sell and distribute light, heat and power for any purpose for which the same may be used, at Caughnawaga, Que. Incorporators: Frank Mc. Jacobs, Jacques Curotte, etc., Caughnawaga, Que.

Municipal

Regina, Sask.— The city is contemplating the erection of an abattoir.

Kingston, Ont.—The water mains are in a serious condition, and will be remedied.

Tottenham, Ont. — This village will spend $14,000 on the installation of a waterworks system.

Longueiul, Que.—The council of Montreal South, is contemplating taking water from Longueiul, Council.

Winnipeg, Man.—A booster pump for Fort Rouge, to raise the water pressure, is being reported on by the city engineer.

Galt, Ont. — The superintendent of waterworks has been authorized to order sufficient steel pipe to complete the trunk main.

Norwich, Ont.—J. W. Johnston, ,M. O.H. for the Town of North Norwich,

recommends the erection of a township abattoir.

Preston, Ont.— Plans for a waterworks system are being prepared by H. Edgar, engineer. The estimated cost is $53,000.

Camrose, Man.—A flow of gas of half a million feet a day has been struck by the town, and will be used by several industries.

Sydney, N.S.— The fire commission contemplate the purchase of a motor combination fire truck. A 90 h.p. truck is recommended.

Medicine Hat, Alta.—In order to dispose of the garbage and rubbish of the city, the engineering department are making arrangements for installing an incinerator.

Calgary, Alta.—The city council has decided favorably on the submission of a by-law for $360,000 for the improvement of the plant and buildings of the Calgary exhibition.

Galt, Ont.—The water commission has decided to continue the laying of the trunk main through the town, and has ordered the superintendent to order more steel pipe.

The Pas, Man. — A by-law to raise $130,000 for completion and extension of waterworks and sewers and installing electric light plant was carried by a large majority.

St. Catharines, Ont. — The Ontario Board of Health has directed the city of St. Catharines to establish a filtering system in connection with the waterworks system; mechanical filtration of the gravity type being preferred.

Tenders

Ottawa, Ont.—The City of Ottawa, Canada. will open bids February 3 on 87 miles of 51 to 58 in. riveted steel pipe. The amount will exceed 50,000 tons.

Winnipeg, Man.—Tenders, addressed to the Chairman, Board of Control, will be received up to January 22, for the manufacture, delivery and erection in the power house at Point du Bois of one head gate and head gate lifting mechanism, including the necessary accessories. M. Peterson, secretary.

Ottawa, Ont. — Work is advancing rapidly on the new Welland Canal and Section 8 will be the next for which tenders will be called. This is the section next to Port Colborne, and will be an expensive cut, as it is through rock for the most part. Plans and specifications are now in preparation, and tenders will be called for during the winter.

Railways—Bridges

Quebec, Que.—The C.N.R. is negotiating for the purchase of the Quebec and Saguenay Railway.

Montreal, Que.—The Montreal Tramways Co. will extend its system along Van Horne Ave. to the city limits next spring.

Campbellford, Ont.—The proposal has been revived to build a railway between Cobourg and Havelock and take in Warkworth.

Iroquois, Ont.—The Township of Matilda will spend $6,000 on a bridge over the Petite Nation River. Eli Merkley, Reeve; J. J. Payne, clerk.

Toronto, Ont. — The Dundas street bridges, which have for a long time been recognized as one of the danger spots of the city, will be entirely re-constructed next year.

St. Catharines, Ont.—The C.N.R. intend completing the line from St. Catharines to Hamilton within three years, and the section from Hamilton to Toronto within five years.

Port Colborne, Ont. — Rumors have been prevalent in Bridgeburg this week, that the Boulevard Commission have definitely decided to extend a trolley line up the boulevard from Niagara Falls the coming spring.

Welland, Ont.— The Street Railway Company have decided to remove the rails from North Main Street and will not put down this extension until next spring. An extension of the franchise is to be asked for.

Ottawa, Ont.—The Calgary & Fernie Railway Co. will apply to Parliament for an Act extending the time for the construction of its authorized lines, and to change the head office of the company from Fernie to Calgary.

Barrie, Ont.—The first section of the Toronto, Barrie & Orillia Electric Railway to be built is the portion in this town. Work is to be begun by April next, and the line in the town will be finished by Sept. 1914.

St. John, N.B.—The petition of the Quebec Extension Railway Co. to construct a railway across the northern part of Maine, between the New Brunswick and Quebec boundaries, has been approved. The proposed road will extend from Caribou to a point above Megantic, a distance of 110 miles, and will be part of a projected railway from St. John, N.B., to Quebec.

Vancouver, B.C.— The Kettle Valley Railway Co. will apply for an extension of time for construction, also for the right to build a branch line from Otter Summit, by the most feasible route, to Aspen Grove mineral district, a distance not exceeding thirty miles.

Ottawa, Ont.— Application will be made to Parliament for an amendment to the Act incorporating the Lake Erie & Northern Railway Co., empowering it to increase its securities from $30,000 to $45,000 per mile, and to give it power to borrow money for construction work.

Penetanguishene, Ont. — The Mayor and Council of Penetanguishene are taking up the matter of procuring electric railway connection with the C.P.R. at Port McNichol, and are in correspondence with the Hydro-Electric Power Commission with a view to procuring estimates of cost and arranging details.

Regina, Sask.—Hon. J. A. Calder announces that actual work on the G.T.P. bridge over the South Saskatchewan river will be commenced immediately. The Government intends giving the company a further guarantee of $2,000 per mile, and in addition $1,300,000 to cover the cost of two railway bridges, one of which is on the line from Poung to Prince Albert.

Toronto, Ont.—The Harbor Commissioners have approved plans and specifications for improvements to be made at the mouth of the Don River and the construction of a lift bridge at Cherry street. The work will be done on day labor by the Harbor Board. It was announced by Secretary Lewis that the work will be commenced in April next. The improvements, including the bridge, will cost in the neighborhood of $294,000.

Trade Gossip

The Keeton Motor Car Co., Brantford, have increased their capital by $150,000.

The International Harvester Co. will run their plant full blast the first of the year, it is reported.

London, Ont.—It was said a few days ago that the London and Port Stanley Railway Commission will invite C. M. Eastman, Windsor, to become manager of the city's line when it is electrified.

The Swedish General Electric Ltd., until recently known as Kilmer, Pullen & Burnham, Ltd., Toronto, have been awarded the contract by the City of Calgary, for the supply of a motor generator set at $18,250.

The National Steel Car Co., Hamilton, has received a big order for steel cars from the Grand Trunk Pacific, Great Eastern, and Montreal & Southern Counties Railway Companies, and this will practically keep the entire staff running through the winter.

The Consumers' Rubber Tire Co., a new concern, which will establish its factory at St. Catharines, Ont., has applied to the Dominion Government for a transfer of a lease of 2,000,000 feet of water per day from the Welland Canal, granted to the H. Goodrich Co., which has decided not to locate in Canada.

The Union Carbide Co. of Canada, Welland, have purchased two De Laval 1,300 gallon per minute pumps, each to operate against 150 feet head, and two centrifugal sewage pumps for their plant. The Turbine Equipment Co., Toronto, the De Laval agents, will also supply all auxiliary equipment necessary for the installation of these pumps, including gasolene engines, etc. These engines will be used in case the electric power at any time is out of commission.

Personal

P. J. Stevens, factory superintendent for the Hoyt Metal Co., Toronto, has left for St. Louis and Chicago where he will visit several lead plants.

J. C. Stewart has been appointed manager of the Toronto Wire Nail & Tack Co., West Toronto, which has been acquired by the P. L. Robertson Mfg. Co., Milton, Ont.

H. E. Pawson, has been appointed electrical engineer for Prince Albert, Sask. He was formerly with the Phoenix Dynamo Co., of Bradford, Eng., and more recently with the Appalachian Power Co.

William J. Shaw, who has been engaged in promoting the International Tool Steel Company of Port Hope, the plant for which is in course of construction, died at 227 Leslie St., Toronto, December 29, aged 73.

P. L. Robertson, president and manager of the P. L. Robertson Screw Co., Milton, Ont., is at present in England completing the organization of the Recess Screw Co. under British patents. This will be one of the foreign branches of the Milton Co.

W. E. Davidson, secretary of the Pearson Mexican Corporations, having head offices in Toronto, which include the Mexican Light & Power Co., the Mexican Tramways Co. and the Mexican Northwestern Railway Co., died Christmas Day on a steamer in the Gulf of Mexico.

Arthur Grace, recently elected Commissioner of Public Works, Lethbridge, Alta., went there as engineer in charge of the construction of the Alberta Railway & Irrigation Co.'s irrigation works. He has had lengthy experience as an engineer in railway construction, and has had considerable civic experience in the construction of waterworks. He is an authority on gravity systems.

Arthur Reid, recently elected Commissioner of Public Utilities, at Lethbridge, Alta., is a Newfoundlander. When a young man, he entered the shops of John McDougall & Co., Montreal, and served six years as a machinist apprentice. He subsequently went to Glasgow, Scotland, and for some time worked in the largest marine engineering shops on the Clyde. He then took to sea life for three and a half years, working as a marine engineer and was awarded a first-class certificate of the British Board of Trade. He returned to Montreal to the firm of McDougall & Co., and was employed as erecting engineer, making a specialty of electrically driven turbine pumps. It was while on this job he was sent to Lethbridge to instal the waterworks pumps, and his services were secured by the city.

Catalogues

W. S. Rockwell Co., New York, have sent us catalogue No. 20, descriptive of the many types of furnace which they manufacture. Illustrations are given of "Rockwell" furnaces built for every kind of service, also a list of industries and operations where furnaces are part of the equipment. Copies of this catalogue may be had on application.

Economy Pumping Machinery, is the title of a new catalogue which has been issued by Thomas & Smith, Chicago. The catalogue deals fully with the "Economy" line of pumps which includes centrifugal, bilge and deep well pumps, sewage ejectors, etc., motor or belt driven. Each type is illustrated and described together with a table giving principal sizes and ratings. In many cases a specification is included. The catalogue also contains some suggestive specifications and several pages of useful information on pumps and hydraulics, which will be helpful when considering pumping propositions.

1913 GRAIN EXPORT FROM MONTREAL.

THE export grain trade from the port of Montreal for the season 1913 has been a record one in the history of the trade and port. The total shipments of all kinds of grain amount to 54,305,172 bushels, as compared with 38,918,264 for the season 1912, showing the handsome increase of 15,286,908 bushels,, which to a large extent may be attributed to the remarkable improvements made within the past few years in the facilities of handling grain at the port. The elevator capacity has been increased considerably, and this, coupled with the cheaper all-water rates for grain from Fort William and Port Arthur and the splendid service obtainable from the different Lake lines of steamers, induced exporters to forward all the grain they possibly could by way of Montreal. Notwithstanding these facts, some very large quantities were also exported via United States ports.

Another very important feature in the export grain trade this year which must not be overlooked was the fact that the port was favored with the largest number of tramp vessels ever known owing to the good rates being paid for carrying grain. During the season thirty-seven of this class of vessels arrived, which carried 10,858,555 bushels of grain, divided up as follows:—Wheat, 5,393,319 bushels; oats, 1,084,774 bushels; barley, 1,937,338 bushels; and flaxseed, 2,443,124 bushels. The largest cargo of grain that ever cleared from the port was carried by the S.S. Kim for Rotterdam, which amounted to over 450,000 bushels, and shipped by the British Empire Grain Co., Ltd. The largest portion of the business was done in wheat, which amounted to 33,252,893 bushels, showing an increase of 2,281,836 bushels, as compared with 1912, while flaxseed came next with a total of 8,253,544 bushels, an increase of 8,214,410 bushels; oats third with an increase of 731,653 bushels; and barley fourth with an increase of 3,966,550 bushels. There were only a few small lots of corn shipped owing to the fact that prices in the United States advanced to such high level on the smaller yield of the crop of 1913 that exporters could not compete with other exporting countries of corn.

The shipments of grain to Bristol or Avonmouth were the largest of any other port, and show an increase over last year of 5,778,989 bushels, while Hull comes second with an increase of 4,504,956 bushels, and Rotterdam third with an increase of 2,352,752 bushels; but, strange to say, the only port with any decrease of importance was Liverpool with 1,003,048 bushels.

With reference to the shippers, Wight & Esdaile have the credit of heading the list again this year, with a total of over 21,750,000 bushels, showing an increase of over 8,111,000 bushels as compared with 1912, while Thomson & Earle have second place with a total of over 14,134,000 bushels, an increase of over 4,932,000 bushels. The British Empire Grain Co., Ltd., are third with a total of over

General Machinists
39 WENTWORTH ST. NORTH, HAMILTON, ONT.

4,548,000 bushels, an increase of over 1,330,000 bushels, and Jas. Carruthers & Co. come fourth with a total of over 4,360,000 bushels, an increase of over 1,253,000 bushels.

GALT, ONT.

THE town of Galt, Ont., has this year added to its importance as a manufacturing centre. In recent years some of the older established concerns have extended their plants, but this year has seen new factories built. Perhaps from an engineering standpoint the most important is the new plant which the B. F. Sturtevant Co., of Canada, Ltd., have established and which is referred to in another issue of our journal. The Roelofson Elevator Co. also referred to is a year or two older. Other comparatively new concerns are the Galt Shoe Co., and the Galt Brass Co., making plumbers' supplies. The Victoria wheel works have built a new plant for making wooden wheels of all kinds. The Narrow Fabric Weaving & Dyeing Co. make labels and tags for dry goods, boots, etc., while under construction is the factory for the Galt Knife Works where steel machine knives and cutters will be made.

The C.P.R. have built a large freight shed and the Lake Erie & Northern Ry. will enter the town sometime in the spring. As a further inducement to manufacturers to locate in Galt, the Hydro-Electric power rate has been reduced from $23 to $21.50 per horse power per year. At the municipal pumping station, two motor driven turbine pumps have been installed to take care of the increased demand, the population being estimated at 12,000.

CUT GEARS
Spur, Bevel And Worm

Spiral, Steel, Raw-Hide
ACCURACY AND PROMPT DELIVERY
When you want a gear cut you want it quickly,—we emphasize our promptness without sacrificing accuracy.

No More Running Heavy Table along by Hand

The New Fast Automatic Feed for Quick Movement of Table in Either Direction.

A simple movement of a lever and the table travels quickly to any desired point, or returns for another cut.

When the lever is thrown to disengage the fast automatic feed the regular automatic feed is again brought into action without any extra operation.

The Fast Automatic Feed is driven from main pulley by belt. A friction clutch in feeding mechanism transmits drive to table feed screw. These two points eliminate danger of damage to cutters or machine.

Write for circular of our No. 5B Heavy Plain Milling Machine.

What 50,000,000 Files a Year Mean To You

That 50,000,000 NICHOLSON-made-FILES are used each year, means that you simply can't go wrong by using these files.

It means that thousands of Executives, Superintendents, Purchasing Agents and Department Heads have long since found the NICHOLSON the most efficient and economical file to use.

The counsel and example of this host of technical experts will interest you. They are unanimous in their fact-backed decision to

The A. M. Ellicott Co, 301 James St , Montreal Que.
Sole selling agents for the Province of Quebec

Costs 250% More to RIVET Than to SPOT WELD

This boy is Welding Stove Bodies

He does more work than NINE RIVETERS can do

LABOR COSTS REDUCED FROM 60 TO 95%

There is hardly a riveting job that cannot be done more cheaply and better the electric way—the "TOLEDO" way. Try a "TOLEDO" for 30 days. If it doesn't save money for you—you don't want it; ship it back. **That** shows **our** confidence in "TOLEDO" welders. Send us samples of the work you want to do. We will weld them free of charge, return them to you, and tell you what you can save.

Bulletin No. 15 tells about spot welders. **Bulletin No. 14 about butt welders.**

NO LEASE NO LICENSE NO ROYALTY

THE TOLEDO ELECTRIC WELDER COMPANY

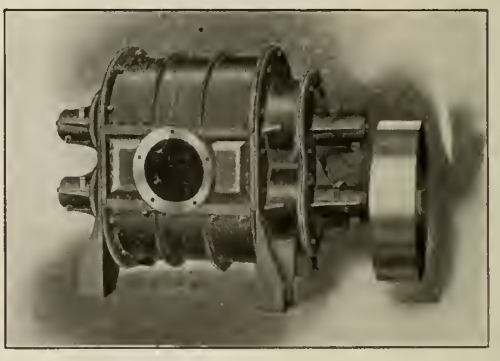
Do You Burnish A Bushel Of Small Metal Articles with 15 Minutes' Labor?

If not, why not? Why should you pay experts for hours or days of hand-buffing, when you can get the same work done better at a labor cost of only a few cents?



The Abbott Burnishing Barrel

will take from a peck to a bushel of small metal articles at a time, and burnish them perfectly in one to five hours. The operating cost is a couple of cents worth of soap chips, some water, one-half to one horse power to run it, and about five cents worth of time (15 minutes) for one operator to load and unload it. Nor is this economy at the expense of quality, for the finish is smooth, hard, brilliant and uniform—no broken or bent parts—no material removed. It is economy plus efficiency.

Write for free booklet and approval offer
And send along samples for burnishing.

The Abbott Ball Company
1047 Elmwood Avenue Hartford, Conn.

BLOWERS

ROTARY POSITIVE PRESSURE TYPE

Weighs less and occupies less space for the same displacement per revolution than any other two-impeller blower.

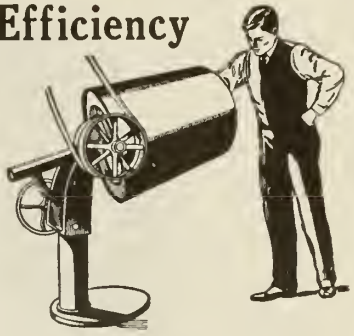
Electric and Handpower Cranes

For any service, span or capacity.

Our designs are the result of many years' experience in building cranes and can be depended on for reliable and efficient service. Special attention given to safety and accessibility. Let us figure on your crane problems.

Catalog on request.



Complete Foundry Plants

Grey Iron, Brass Car Wheel

Pipe Steel (O.H. and Convertor) and Malleable

WHITING FOUNDRY EQUIPMENT CO. HARVEY-ILL. U.S.A. CHICAGO SUBURB.

Where the Efficiency Engineer Was Stalled

He did big things in every department—but one. When he tackled the tumbling room and made a thorough analysis of conditions he reported that he couldn't make any suggestions for improvement.

GLOBE TUMBLING BARRELS

were the chief equipment of this plant's tumbling room. That may have accounted for the high standard of the work.

With Globe Barrels one man can attend several barrels. They can be filled, emptied and the work inspected while running. When gentle or violent tumbling is wanted the operator simply has to change the angle at which the barrel is running and while it is running.

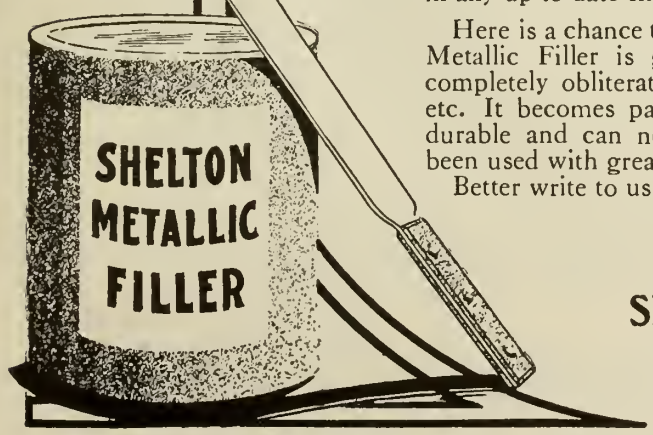
That's all there's room for here. If you want to know the rest about Globe Tumbling Barrels write for free catalog 2.

Eight Stock Sizes—$50 to $170.

THE GLOBE MACHINE & STAMPING CO.
Cleveland, Ohio, U.S.A.

A sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN

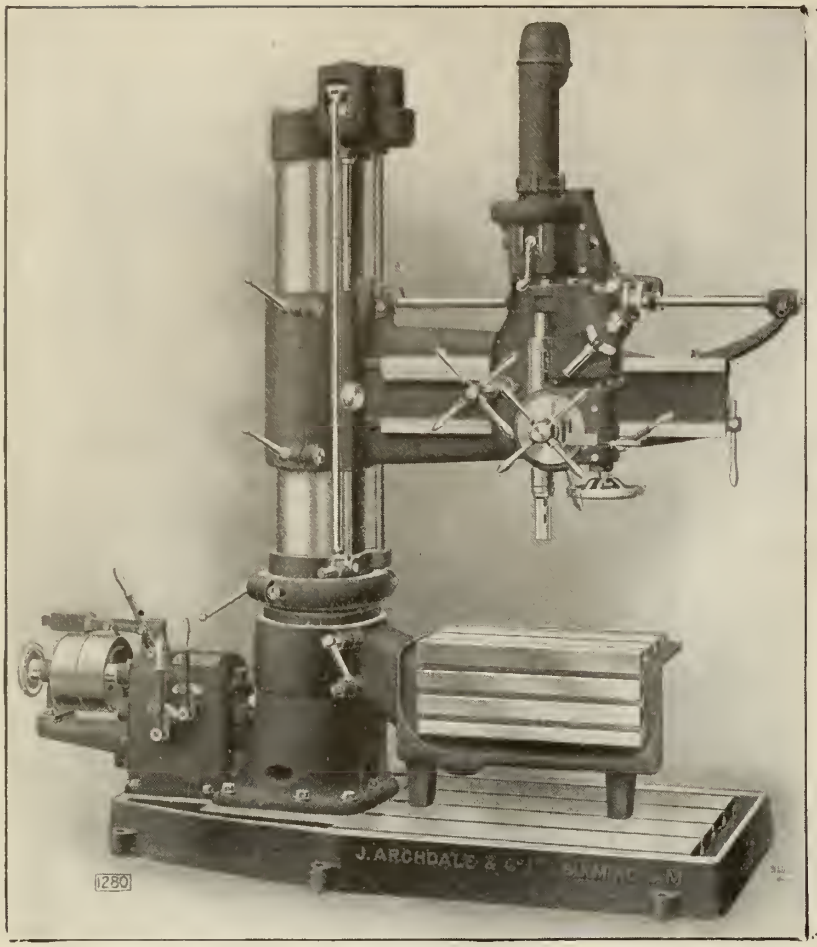


Shelton Metallic Filler

is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years.



Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER

At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*

SHELTON METALLIC FILLER CO.
DERBY, CONN.

HIGH SPEED
RADIAL and
VERTICAL
DRILLING
MACHINES
A SPECIALTY

Here is one with 3½ feet Radius, Drills in Steel 2 in. diam. ARM adjusted Vertically by Power, EIGHTEEN SPINDLE SPEEDS, FOUR GEAR-DRIVEN FEEDS, FEED instantly engaged by Friction Clutch AND OTHER IMPROVEMENTS.

RADIAL DRILS FROM 2½ ft. to 7 ft. Radius. VERTICAL DRILLS with Spindles up to 3 in. diam. CAPSTAN LATHES, MILLING MACHINES.

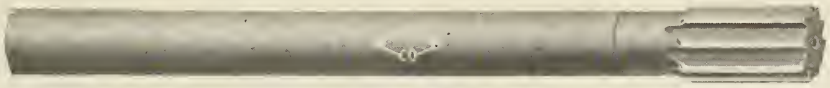
"W&B" Reamers Are Ready for Those Getting Less than the Best Reamer Service

Wouldn't a reamer that will hold to size on two or three more jobs, than other reamers, interest you? "W & B" Reamers are made from highest grade steels, properly designed and tempered to give longest life and absolute accuracy.

Take the best reamer in your shop and put it to the service-test with a "W & B" Reamer. Note the quality of work done by each reamer.



When the test is complete buy the grade of reamers that show up the best. This is the kind of proof that sells "W & B" Reamers.

From The Rough Stock To The Finished Drill In One Chucking

Rough Stock.

Wilt Twist Drills are made by a process that accomplishes at a single chucking the work that under ordinary conditions requires five or six separate operations.

It is a revolutionary process and marks a noteworthy advance in twist drill manufacture.

It is a process by which accuracy to a remarkable degree is assured.

A process by which a clean-cut, well-defined clearance is obtained.

A process which, coupled with hardening of scientific accuracy, makes Wilt Twist Drills the most efficient drills manufactured to-day.

Try Wilt Twist Drills on your hardest job — note their accuracy — their uniformity — their cutting ability, and the amount of work they can do without regrinding. You will be amazed at their efficiency and economy.

Ask your supply man or write direct.

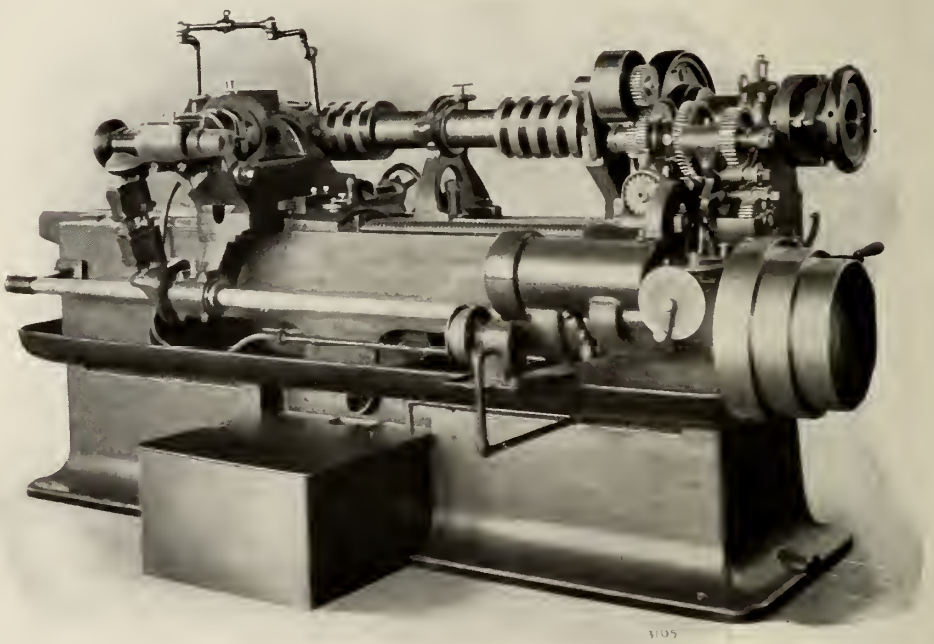
Best For Milling Threads on

Auto Steering and Elevator Worms, Spindle Noses, Feed and Lead Screws, etc., etc.

Let us prove to you that the most rapid, accurate and efficient method is by means of

P. & W. Thread Milling Machines

The efficiency of these machines on this class of work is being demonstrated in many of the largest shops in the country. Send samples or drawing and we shall be glad to tell you what the P. & W. Thread Miller will do on your work.



Smooth, Accurate Threads At One Cut

The rigidity of the design and accuracy with which these machines are built and aligned, gives a smooth, accurate thread at one cut.

One Man Can Operate Several Machines

The automatic features of the P. & W. Thread Milling Machine enable one man to keep several machines busy, which makes possible a very large output.

Write for catalog, "Thread Milling Machines" fully describing all sizes.

HAMILTON ONTARIO

A GARVIN MILLING MACHINE FOR EVERY NEED

No. 21 Plain Milling Machine
Use Code . . . ABSORB

Fully 80 per cent. of the Milling Machines manufactured are used on manufacturing work, and a great majority of this 80 per cent. is used on what is called long set-ups. Did it ever occur to you that a simple Milling Machine without frills is made just as accurately as the so-called standard machine, and would effect a great saving in the first cost of your machine tool equipment?

Again, a less expensive operator can be used.

Think this over and investigate the merits of our No. 21 Plain Milling Machine. Made especially for manufacturing work and used by large concerns in gangs of six to one operator.

Machines are simple and accurate, having lots of power, and enough feed and speed changes to take care of the work they are intended for.

Adjustments—18 x 6 x 13 inches.

Immediate Deliveries

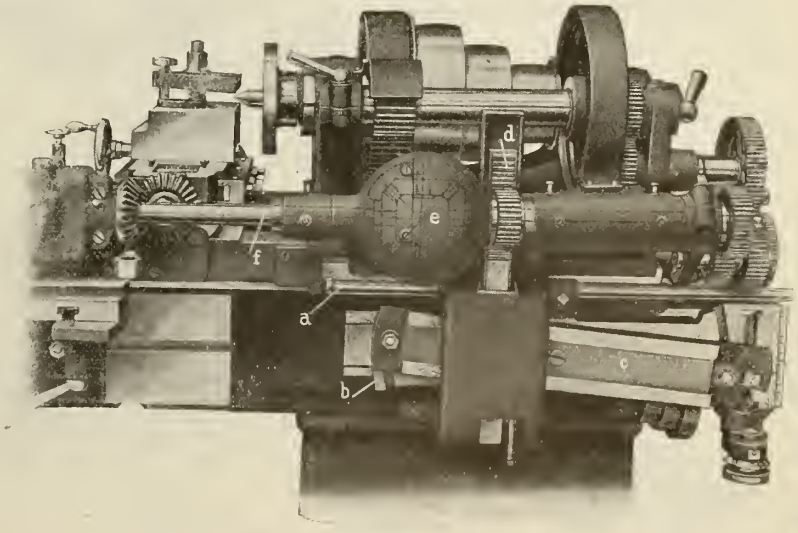
Backing-off Lathes

With Draw and Screw Cutting Spindle

Centre	9 in.
Length between centres	30¾ in.
Diameter of work above slide rest	6½ in.
Hollow Spindle	¾ in.
Number of teeth straight parallel	3-40
Spiral Slots	4-18



For cutting spiral shaped milling cutters of any pitch or number of teeth with a small number of change wheels there is fitted at the back of the Lathe a patented correction apparatus which, according to the adjustment of the rotating bars ("C"), controls the movement of the differential gear ("E"), and thereby also the backing off curves of the slide rest. This slide rest does not rotate, and therefore guarantees the greatest stability, even when using very broad shaping steels.

Getting a Starrett for that "Special" Big Job

For the large work in your shop that must be measured with micrometer accuracy the ordinary one and two-inch machinist's micrometers are too small. You must have in the tool room a micrometer which gives perfect accuracy and wide range. This

Starrett
Government Micrometer

is a tool room micrometer made for large work. It was made to suit the requirements of the Ordnance Department of the United States Government and many of them are now doing service there. The micrometer frame is cut from steel plate and is covered with hard rubber to prevent expansion from the warmth of handling. This government micrometer is made in three sizes, No. 127 A 0 to 4", 127 B 4"-8", and 127 C 8"-12". The micrometer adjusts 1" reading 1-1000". Tail spindles forming anvils are provided and these may be quickly attached to the micrometer, making it possible to measure the work without turning the spindle more than 1".

Let us send you Catalog 203 describing the full line of Starrett Tools

PORT HOPE **CANADA**

HERE is a mass of the Aloxite crystal just as it comes from the electric furnace—every crystal in this mass is hard, sharp, and tough, every crystal is uniform in its cutting qualities. These crystals are crushed to just the size required, are carefully mixed with certain bonding materials, and made into fast, clean, cool, cutting **ALOXITE WHEELS.**

The crystals do the cutting, and they are so tough and hard, and are so bonded that the Aloxite Wheels always stand up on the job, show long life, hold their shape. In a big Cincinnati plant Aloxite Wheels are used for cutter grinding—they do wonderful work, never drawing the temper from the steel, always cutting free and clean.

CORRESPONDENCE A PLEASURE

Sherbrooke Machinery Co., LIMITED

SHERBROOKE, QUE.

BLOWER DEPT:

"To Sit Down to Enjoy 'Paradise' is to Lose It"

The other day an old man—a sad-eyed derelict, a tramp—who had wasted the important years of his life, stood in front of a saloon, shaking his fist and cursing the place, not because he objected to the existence of these places, but because he was no longer permitted to enjoy the things which had brought about his failure and his undoing.

The great handicap the average man who is just coming out of college must overcome, is the idea that certain kinds of work are menial and degrading. This idea on the part of many college men is the result of having been supplied with the necessary funds to complete their college course, or to spend a number of years in college, during which time they are not actually self-supporting—all of which constitutes a period in the life of the average young man when he is apt to indulge in day-dreaming, in useless fancies, which take him away from the world of activity, away from the world of life and usefulness.

The problem of civilization is to set each individual to doing something useful, something worth while, and the ideal race will be evolved when each individual is set at work to do the thing which he is best fitted or prepared to do. This condition of things, perhaps, will never be reached because it is impossible for most of us to know what we are best fitted for until after we have passed the age of thirty—and, in reality, the crucial period or the great turning point in the career of the average man is between the age of forty and forty-five.

Many men at the age of thirty-five have succeeded to a certain degree, yet at the age of forty, when they have accumulated a little money, and are permitted to enjoy a few of life's pleasures of which they have been deprived, they neglect their business, neglect their responsibilities to enjoy the things which, perhaps, five years of success have placed at their disposal. This means a "letting-up" or a going-back in the career of an individual.

The only success in life which is worth while, the only success which is permanent and the only success worthy of the consideration of the real man is that success which shows a growth to-day founded on yesterday's experience. To sit down to enjoy 'Paradise' is to lose it. To sit under the shade of a tree and pine for the shade trees of the 'New Jerusalem' is to lose the benefit and pleasure of shade trees in this world and to lose also the opportunity to enjoy the shade trees of the 'New Jerusalem.'

We make ourselves worthy of better things only by using what we have. The only way we can successfully and consistently use what we have is to do well that which is placed in our hands to be done. The man who has nothing to do is not happy. The man who has unlimited money to spend without consideration or concern as to its production is not happy; because happiness lies in the pursuit of things and not in the attainment of them.

If we stop for a moment to enjoy or to indulge in "yesterday's success," we take a step backward toward imperfection, and there will be no success for us to enjoy to-morrow. The supreme degree of happiness, that is, the happiness which is most lasting, the happiness which is really worth while, the pleasures which are really substantial and which lend sunshine and gladness to all the hours and days of our lives, is the feeling that all work is useful, that the greatest sin is idleness, that the only happiness is to be employed at some useful work.

Too many young men start out in life facing work and responsibility as a great 'green dragon.' This idea is wrong, and no man will ever know what real happiness is until he realizes that all work is useful, honorable and worthy, and that all laziness and idleness is sinful, degrading and disgusting.

The Plant of the Canadian Sirocco Co., Ltd., Windsor, Ont.

Staff Article

Like the new factory of the H. Mueller Mfg. Co., a description of which appeared in our January 1, 1914 issue, the plant of the Canadian Sirocco Co. at Windsor, Ont., is also an instance of American enterprise in the industrial sphere of our Dominion, and gives additional proof of the confidence which manufacturers across the line have in the Canadian market.

RATHER more than two years ago the American Blower Co., Detroit, decided to manufacture their product in Canada, and for this purpose a Company was incorporated under the name of the Canadian Sirocco Co., Ltd. A site covering four acres was purchased at Windsor, Ont., in the factory district adjoining the Essex Terminal Railway. A building was erected and equipped and manufacturing commenced in 1911. The plant as it exists at present was built as the nucleus of a larger plant, and consists of one building, 308 x 50 ft. A siding from the railway runs along the east side of the building, and provides excellent facilities for the shipment of the product, which consists of "Sirocco" fans, heaters and "Detroit" steam traps. The building is of brick construction, with steel columns and roof trusses. The windows are fitted with "Kahn" steel sash and ribbed glass. With the exception of a part at the south end, where are the office and stores, the whole structure is devoted entirely to the manufacture of the product.

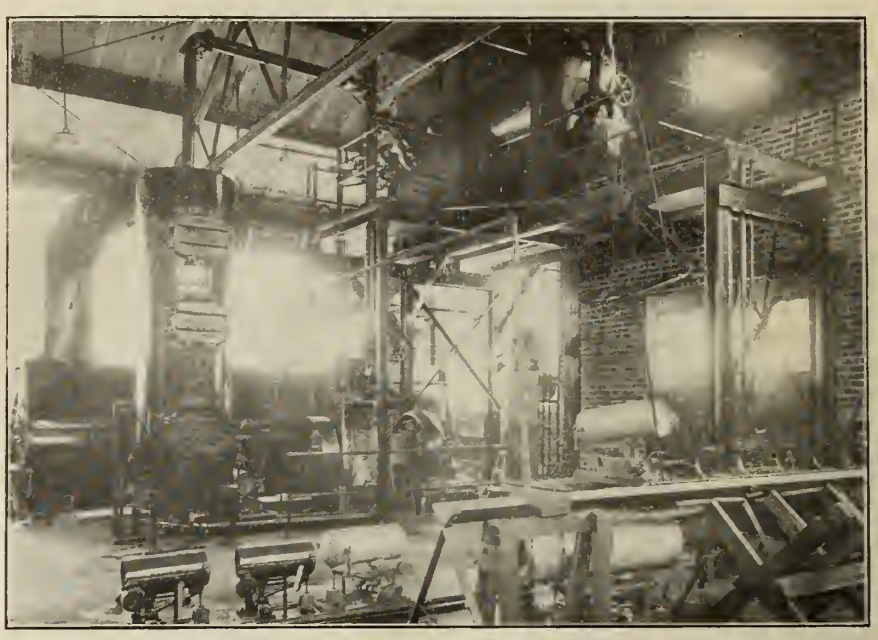
The handling of the materials and product is well taken care of by the system of overhead cranes installed. At each end are two hand operated travelling cranes running across the shop, each crane being equipped with a triplex block. Connecting these two sets of cranes and running lengthways is an overhead monorail system, also equipped with a 3-ton triplex block. This arrangement allows for the working of the materials through the various operations towards the centre of the shop for assembling. At the north end the heating coils and traps are manufactured, while at the south end the plate and structural work for the fans is done. The assembling floor is connected to the shipping platform by a gantry, on which operates an overhead hand travelling crane equipped with a 5-ton triplex block supplied by the Rounds Co., Cleveland, O.

Machine Shop.

In that section of the shop devoted to the manufacture of fans there are a number of machine tools, the principal being a Brown, Boggs & Co., Hamilton, double crank press, a Long & Allstatter 84 in. gate shear, a punch by the Cleveland Punch and Shear Co., also circle shears with a capacity up to 3/8 in. steel plate. This machine will cut plates to any shape, and is used principally in the manufacture of fan housings and similar work. A Canton Foundry Co.'s handy crane is used for carrying materials about the shop.

The other half of the shop is devoted to the manufacture of heater coils and "Detroit" steam traps. The pipes are carried from outside through an opening in the wall at the end to a machine, where they are measured and cut off to the desired lengths. The pipe lengths are then threaded in a double head threading machine fitted with "Landis" die heads and supplied by the Canada Machinery Corporation. The elbows are put on in a special machine designed by the Company for that work. The cast iron heater bases are reamed and tapped on a machine supplied by the Murchey Machine Tool Co., Detroit. The table or carriage for this machine is mounted on roller bearings, which allow for the movement of the work during the operations, with the least possible effort on the part of the operator. The heater bases are previously drilled on a Pawling & Harnischfeger horizontal boring and drilling machine, which is motor driven with speed control. This machine is also fitted with a balanced drill head for accommodating various sizes of work. There are also installed through-

INTERIOR OF FAN AND HEATER ELECTRIC SHOP.



out the shop a number of standard tools of various types. The machines are arranged in four groups, and the line shafts in the various sections are driven by four Canadian Westinghouse motors —two 20 h.p., one 15 h.p., and one 10 h.p.

Power Plant.

The power plant is located in the north-west section of the building, and consists of a 90 h.p. "Monarch" horizontal tubular boiler, supplied by the International Engineering Works, Ltd., Amherst, N.S. The boiler is fired by natural gas, and supplies steam to an American Blower Co. vertical high speed engine. The latter is fitted with combination forced and gravity lubrication. There are 2 h.p. cylinders, 7 in. diameter by 7 in. stroke, and direct connection is made to a 40 k.w. D. C. Fort Wayne Electric Co. 3-wire generator running at 450 r.p.m., and supplying current at 220 volts for the motor and 110 volts for the lighting circuits respectively.

The switchboard is equipped with the usual instruments, lighting and power switches, and was supplied by the Fort Wayne Electric Co., Fort Wayne, Ind. The feed water is heated in a 100 h.p. "Dakin" feed water heater supplied by E. Leonard & Sons, London, and has in connection with it two "Detroit" return traps, which take care of the boiler feed; one trap being located on the ground floor and the other below the platform, where the heating system is installed.

On a platform above the power plant is a "Sirocco" heating and ventilating system. The coils in the heater are supplied with exhaust steam and a "Sirocco" fan draws air through the heater and discharges same into the building, the air in the shop being changed every 15 minutes. The fan is driven by an A.B.C. steam engine direct connected. The condensation from the heating coils is taken care of by the return traps. Compressed air is supplied at 80 pounds pressure by an A.B.C. steam engine converted into an air compressor.

POWER AND HEATING PLANT.

General.

The Company is associated with the American Blower Co., Detroit, and is under the management of Mr. Ralph T. Coe. A complete line of fans, heaters and traps are being manufactured at this plant, the engines only being imported from Detroit. It is the intention at some future date to extend the plant when the complete line as made at Detroit will be manufactured at Windsor.

FISHER MOTOR CO., LTD.

ONE of the many enterprising firms in Walkerville, Ont., is the Fisher Motor Co., Ltd. This concern have a well equipped plant for the manufacture of the Vollan's electric butt and spot welders, which are built to meet all requirements and for either a.c. or d.c. current. Additional machinery has recently been installed, and it is probable that extensive additions to the plant will be made early next year to take care of the increasing volume of business.

D. H. McDougal, manager of the Dominion Coal Co., Sydney, N.S., was a visitor in Montreal during last week.

PLANT EXTERIOR, CANADIAN SIROCCO CO., LTD.

Determining the Cutting Power of Lathe Turning Tools*

By William Ripper, D. Eng. D.Sc. and G. W. Burley **

The question of the definite measure of the output of work, or of the removal of material, of which lathe-tools are capable, is one about which there is very little information readily available; and it was for the purpose of determining the behavior of cutting tools over a fairly wide series of working conditions, and of deducing therefrom some practical results, that the experiments here detailed were undertaken.

THE tool steel lathe was built by Joshua Buckton & Co., of Leeds, and is of such a design that it can be employed for testing either high-speed lathe-tools or large twist-drills, the latter being made possible by a special arrangement provided in the loose headstock. It is an 18-inch centre lathe, the bed, however, being of the size usually provided on

Fig. 46.

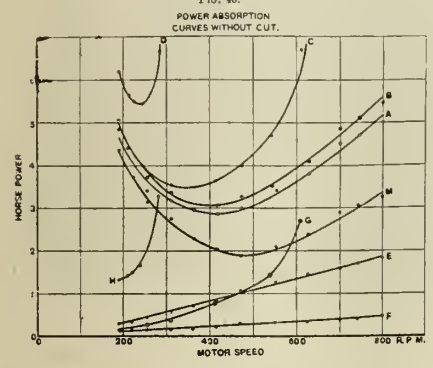


Fig. 48.

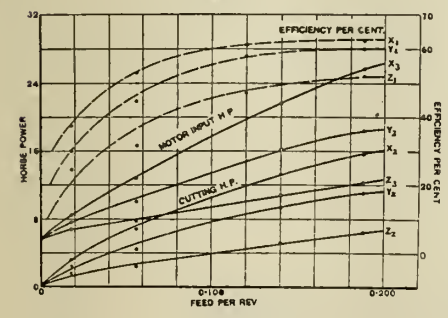

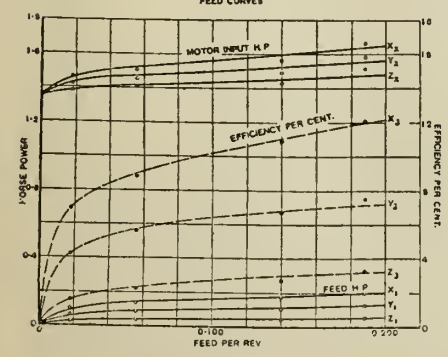

Fig. 49.

20-inch lathes, thus giving extra stiffness.

The overall length of the lathe, including the bed-plate of the main driving motor, is abont 25 feet. The dimensions of the largest test-bar which can be carried between the centres are: length 10 feet, and diameter 25 inches. The test-bar is held by four independent dogs or jaws mounted on a large driving plate, which is carried by the main driving spindle. At the loose headstock end, the bar is supported by an ordinary centre of ample proportions.

Lathe Drive.

The lathe is driven by a 40-b.h.p. direct-current motor. This motor can actuate the driving plate on the main spindle in the headstock in two different ways:—

(1)—Directly, by coupling the armature of the motor to the main spindle.

(2)—Indirectly, through gearing.

The direct connection is obtained by means of a tongue on the headstock end of the motor armature shaft, and a corresponding slot in the motor end of the main spindle of the headstock. This mode of driving is only used when very high rotary speeds are required, as in the case of drill tests. The indirect connection is obtained by means of a pinion on the headstock end of the motor armature shaft, which engages with another pinion mounted on a gear shaft passing through the headstock.

In the headstock, any one of three sets of gears can be used for transmitting the power and motion to the driving plate. This plate is driven by a toothed pinion, which works in gear with the teeth on the back portion of the rim of the driving plate, and which is an integral part of the plate. The power is thus transmitted directly to the rim of the driving plate and not through the main spindle. The gears are so arranged that only one set can be in action at the same time, and they are controlled by means of levers on the front of the headstock. The gears are:—

(1)—Single gear, giving driving-plate or spindle speeds from 50.5 to 202 revolutions per minute, according to the speed of the motor.

(2)—Double gear quick, giving driving plate speeds from 16 to 64 revolutions per minute.

(3)—Double gear slow, giving driving-plate speeds from 5 to 20 revolutions per minute. The gear ratios, including ratio between the driving pinion and driving-plate gear in each case, are as follows:—

Single gear .....1 : 3.96
Double gear quick....1 : 12.50
Double gear slow....1 : 40.00

The Slide Rest.

The slide rest is of the ordinary compound type, having a top swivelling slide, with tool clamps, and a cross or surfacing slide. A large feed apron is provided on the slide rest for carrying gears for power sliding and surfacing. The slide rest is rack driven, the power being supplied to it by a feed shaft on the front of the lathe bed. This feed shaft can be actuated either directly from the main driving spindle in the headstock or by a separate feed motor.

Altogether eight different feeds, travel of the slide-rest per revolution of the test bar, can be obtained for sliding, surfacing and drilling with the direct drive as follows:—

CLUTCH LEVER. Sliding-key Lever.	COARSE. 1	2	3	4	FINE. 1	2	3	4
	Inch.	Inch.	Inch.	Inch.	Inch.	Inch.	Inch.	Inch.
Sliding	1-4	1-6	1-8	1-12	1-20	1-30	1-40	1-60
Surfacing	1-8	1-12	1-16	1-24	1-40	1-60	1-80	1-120
Drilling	1-20	1-30	1-40	1-60	1-100	1-150	1-200	1-300

The feed-shaft drive from the independent feed motor is through a motor feed-gear box containing spur gear and clutches, so that fast and slow feeds are provided for. Feeds varying from 0.090 inch per minute to 200 inches per minute can be obtained when nsing the motor drive for the feed. A graduated dial is mounted on the cross-slide screw, the divisions on the dial being 1-64 of an inch, so that depths of cut varying by 1-64 of an inch can be attained with great accuracy. The zero of the dial is adjustable.

The Headstock.

The loose headstock is of massive proportions, the mandrel or spindle of this being so arranged that it can be fed along either by hand, when making slight adjustments, or by power for drill testing. On the tail end of the screw of the headstock is mounted a worm wheel, with which a worm can be put into mesh. This worm receives its motion from the feed shaft through spur and bevel gearing, and transmits to the screw through the worm wheel.

*Part III. of a paper read recently before the Institution of Mechanical Engineers.

**Dean of the Faculty of Applied Science and of the Staff, respectively, of Sheffield University.

An auxiliary rack is provided on the bed for the special purpose of moving the headstock along the bed whenever required. This is done by means of a handle on the front of the headstock, which is connected to the rack through spur and bevel gears and rack pinion.

The lathe bed is graduated in inches so that the travel of the slide-rest in any given time or for any given number of revolutions of the test bar can be determined. A revolution counter is connected to the main spindle of the driving headstock so that the number of revolutions made by the test bar in any given time can be determined.

LATHE EFFICIENCY TEST RESULTS.

Electrical Plant for Operating Experimental Lathe.

The lathe is driven by means of two direct-current motors, one arranged for the main drive and the other for operating the feed mechanism. These motors take their power from a motor-generator set situated in close proximity to the machine, and the whole forms a good example of an isolated plant for motor driving.

Two-phase current at 2,000 volts pressure and 50 frequency is received from the corporation mains and operates a two-phase, 2,000 volt, slip ring induction motor made by the British Westinghouse Co., and capable of giving 76 b.h.p. at a speed of 960 revolutions per minute. Direct coupled to this is a 50-kilowatt compound wound dynamo of the same make, generating at a pressure of 220-250 volts.

POWER TESTS, HIGH SPEED STEEL, BAR A.

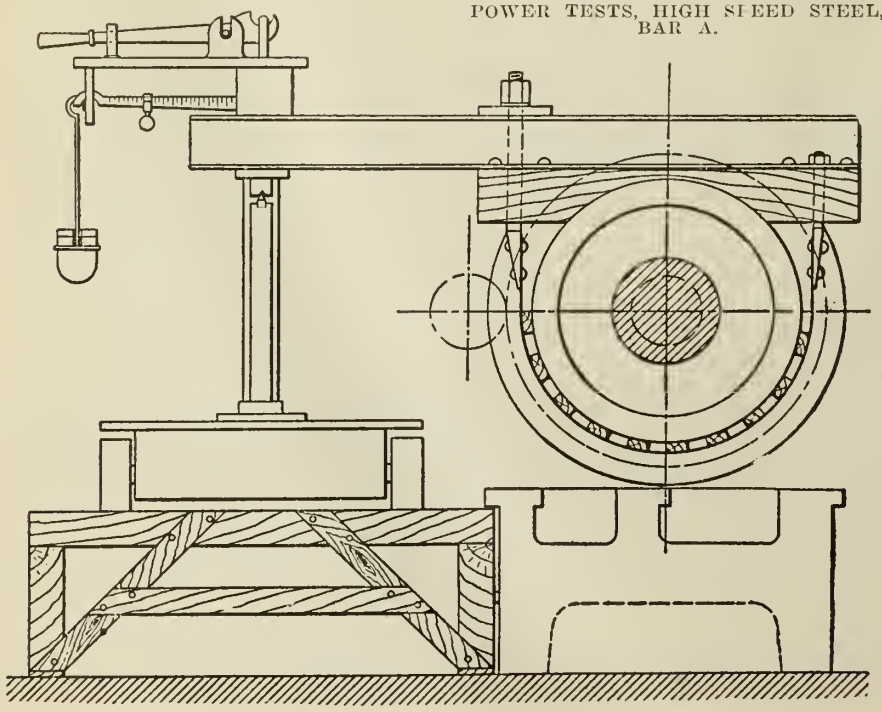

FIG. 47. METHOD OF APPLYING BRAKE TO LATHE.

These machines are controlled by means of a two-panel marble switchboard. The alternating current panel contains a two-phase high tension oil break switch, with automatic overload release; a voltmeter capable of reading either the received or the generated pressure; two ammeters; and a two-phase wattmeter, so that the input to the alternating current motor can be observed. The second panel controls the generator, and is arranged with switches and instruments enabling the input to each of the motors to be observed separately. The chief feature of this panel is that a recording wattmeter is inserted in each motor circuit and a permanent record in the shape of a power-time curve is obtained. The whole of the switchboard and instruments are of Westinghouse manufacture except the voltmeter and the recording wattmeters, which are of Kelvin & White and Elliott Brothers makes respectively.

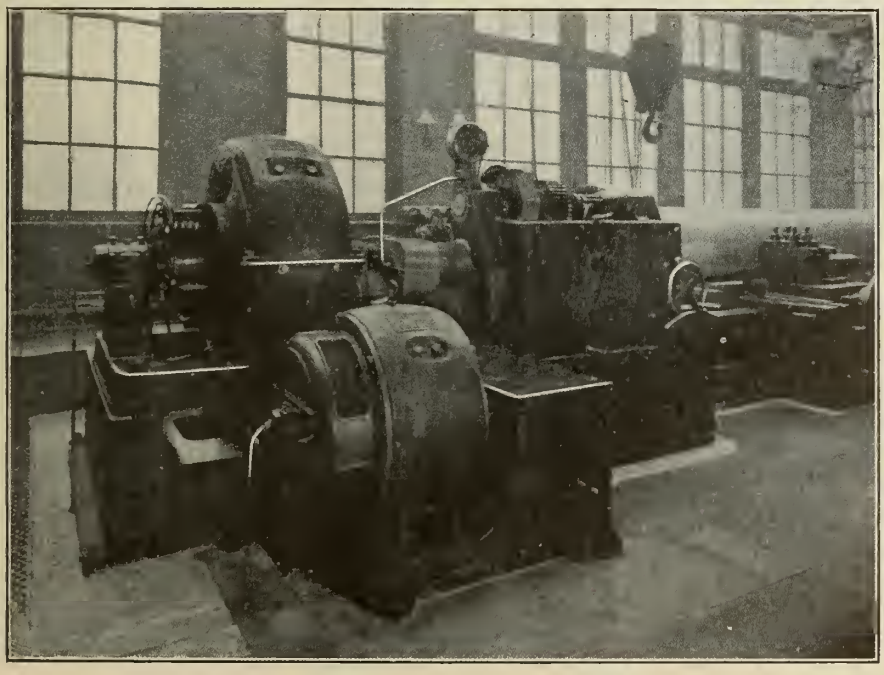
CHEMICAL COMPOSITION OF TEST BARS.

The main driving motor on the lathe is of 40-b.h.p. capacity, made by Vickers. It is a 4-pole, 220-volt shunt-wound machine with interpoles, and is capable of running at speeds varying from 200 to 800 revolutions per minute, the speed variation being obtained solely by means of a rheostat inserted in the field magnet circuit of the motor. The feed motor is a 4-pole shunt-wound 220-volt 5-b.h.p. motor, also of Vickers' make, and is capable of having its speed varied from 275-1,100 revolutions per minute by shunt regulation as in the former case. An electro-magnetic speed indicator is connected by a flexible shaft to each motor.

From the generator panel cables are led to two smaller switchboards containing the necessary gear for starting and operating the driving and feed motor respectively. These boards contain an ordinary type of direct current motor

starter with no-load and over-load release magnets, two main fuses, and a 23-step rheostat for speed variation; there is also a supplementary rheostat for the driving motor, so that speeds intermediate with those given by the former may be obtained. This supplementary rheostat, having eleven contacts, is connected in series with the main rheostat, the two being so arranged that any one of the contacts of the first rheostat can be used in conjunction with any one of the second. Thus, 253 different motor speeds can be obtained for one voltage, these ranging from 200 to 800 revolutions per minute.



TOOL STEEL TESTING LATHE, ENGINEERING DEPARTMENT, UNIVERSITY OF SHEFFIELD.

With the four different methods of driving the face plate of the headstock, with and without gearing, upwards of 1,000 different surface speeds are available for one diameter of test-bar. The rheostat of the feed motor provides for twenty-three different motor speeds, and these with all the possible changes in the feed-gear boxes give upwards of 700 different feeds—travel per minute, for one voltage.

Measurements of Lathe Efficiency.

Experiments were made on this lathe to determine the various losses which occur in the driving motor, headstock gearing, etc., when the lathe runs without cut under the various possible conditions of speed, etc., and also the motor input, useful power, and efficiency when cutting at a given speed for both the driving and the feeding parts of the lathe.

The relation between the various power losses and the motor speed is indicated in Fig. 46. Curve M. represents the case of the motor running light, the horse-power being the motor input—electrically, this being obtained by readings from the switchboard instruments. The fall in the power required with an increasing rate of revolution between 200 and 500 revolutions per minute is due mainly to the reduction in the magnetization current—to produce the weakened magnetic field, being greater than the increase in the armature current required to cover the increase in the armature current required to cover the increase in the mechanical frictional losses in the bearings, etc., due to the speed increase. Beyond 500 revolutions per minute, the latter is much greater than the former; hence the rise in the curve for this speed range.

PHYSICAL PROPERTIES OF TEST BARS.

Curve A is the corresponding curve for the motor and headstock gearing without the driving spindle and face-plate. It was found that the power lost was practically the same for each of the three sets of headstock gearing, provided that the driving spindle and face-plate were not in motion. Curve E, which represents the difference between M and A, gives the net power lost in the gearing only at the different motor speeds.

Curves B, C, and D are the corresponding curves for the motor, headstock gearing, driving spindle, and test-bar without cut. These curves represent the three sets of gearing as follows:—

Curve B: Double Gear Slow..1 : 40
Curve C: Double Gear Quick 1 : 12.5
Curve D: Single Gear .....1 : 3.96

Curves F, G, and H represent the net losses due to the motion of the test-bar and driving-plate.

To determine the horse-power developed at the nose of the tool under a cut, brake-load tests were made on the lathe with different loads, at different motor speeds, and with the different sets of headstock gearing in action. The conditions of these tests were arranged so that, as nearly as possible, they corresponded to actual cutting conditions.

The form of brake used is shown in Fig. 47. The brake-drum was mounted directly on a test-bar which run in the ordinary way, being driven from the face-plate by dog-chucks. The length of the arm of the brake was 45 inches, and the pillar carrying the knife edge rested on the platform of a 20-cwt. weighing machine. The brake horse-power was calculated by means of the formula:

$$\text{B.H.P.} = \frac{2p \times 45}{12 \times 33{,}000} \times PN = \frac{PN}{1{,}400}$$

LATHE TOOL TEST SHEET.

In the cutting tests, in which the cutting speed was 50 feet per minute, the feed was obtained independently from the feed motor, four different average feeds being adopted, as follows:—0.0185 inch, 0.0551 inch, 0.1417 inch, and 0.1880 inch per revolution of the bar. These are the actual feeds, their values having been obtained by means of actual measurement and calculation. The depths of cut were three in number, as follows:—⅛ inch, ¼ inch, and ⅜ inch.

The net feeding power in each case was obtained by taking the difference between the motor input, with the cut in, and with the tool withdrawn, respectively, the slide rest being in motion in each instance. This difference may not be exactly the power required to propel the slide rest against the resistance due to the cut only, but it is sufficiently close for all practical purposes.

The curves in Fig. 48 give the relation between the gross main-driving motor input X_3, the net cutting power X_2, and the overall main-drive efficiency X^1.

The curves in Fig. 49 give the corresponding relation between the gross feed-motor input, the net feeding power, and the overall efficiency.

The curves X are for the ⅜ inch depth, Y for the ¼ inch depth and Z for the ⅛ inch depth.

In the case of the main-drive curves $X_1 = \frac{X_2}{X_3}$. while for the feed curves $X_1 = \frac{X_1}{X_2}$

Moncton, N.B.— Among the plants erected here during the past year, one of the largest was that of the Humphreys Unshrinkable-Underwear, Ltd., the foundations for which were laid in November, 1912, the plant being completed and in operation by the following April. It is built of brick and concrete, and contains 4,000 feet of floor space. Power is generated by gas engines using natural gas. About eighty persons are employed. Among other new plants in this town is that of the Havelock Mineral Spring Co., Ltd., makers of aerated waters, who moved their plant from Havelock, N.B., to Moncton, and equipped it with modern machinery.

Walter Hazlett, of Kingston, Ont., for some time chief engineer on the steamer Kingston, has been appointed assistant to Captain Gilbert Johnston, mechanical superintendent of the passenger steamers of the Canadian Steamship Lines, Ltd., with headquarters at Montreal. He will be succeeded by David Leslie, of the steamer Rapids King.

Steam and Hydro-Electric Power Plants at Kamloops, B.C.

By W. Large

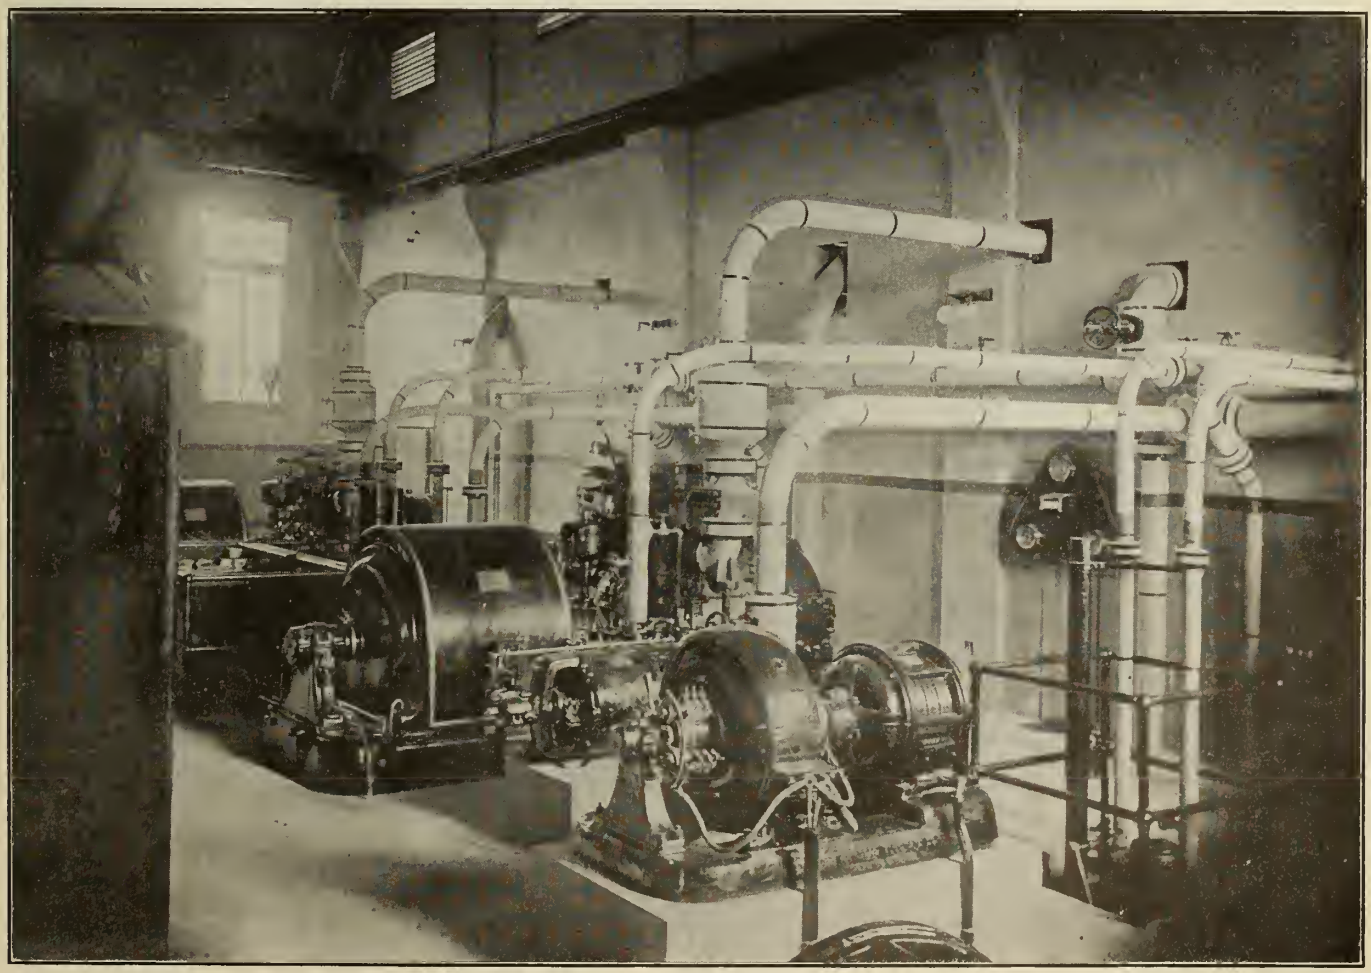
The accompanying text and illustrations serve to show that Western municipalities are fully alive to the requirements of industries seeking location, in the matter of power, light and water for manufacturing purposes, and that, they, in addition, recognize the all-important consideration, of providing an equipment, both tried and up-to-date.

KAMLOOPS opened its new power house on October 28, with everything in excellent shape. The Royal Commission on Indian Affairs who were in the city paying a visit of inspection, were present in addition to many prominent citizens.

It was found last year that Kamloops could not do any longer with its old power house, which had become too small to carry on the increasing demands for water and light, and arrangements were made to erect an entirely new building with all modern machinery. It had also been planned some time ago to bring power from the Barriere River, 40 miles up the North Thompson, where 10,000 horse power was available, if harnessed, and arrangements have been made to use 2,000 horse power to commence with, and to increase the amount as the city's demands may call for later. Bonds to the amount of $460,000 were therefore issued, $200,000 of which was needed for the power house just completed, and $260,000 for the Barriere Rivere development. At present, some 2,400 horse power is generated at the new station.

The main building is of reinforced concrete and thoroughly fireproof throughout. It consists of two bays; one containing the boilers being 40 ft. x 75 ft., and the other, containing the turbines, pumps and other machinery being 50 ft. x 75. ft. The basement of the turbine bay is on the same level as the boiler room floor and contains the auxiliary apparatus, condensers, transformers and air pumps, besides providing storage for operating supplies. The stack is of concrete, and is 78 inches diameter at the bottom, by 175 feet high above ground level.. The equipment of the station is as follows:—

Four Babcock & Wilcox boilers of 250 h.p. each and working at 160 lbs. pressure.



Two boiler feed pumps by the Platt Ironworks, Dayton, Ohio, and a Ford heater.

Two Curtis turbo-alternators of 600 k.w. capacity, 2,200 volts, three-phase, 60 cycles, operating at 3,600 revolutions per minute. These were supplied by the Canadian General Electric Co., and have forced lubricated, water cooled bearings, electric speed changing device and an over speed safety trip. The turbines exhaust into two Wheeler cylindrical surface condensers, which are equipped with turbine driven circulating pumps. The condensers indicate continuously from 27 to 28 inches of vacuum.

One 15 k.w. turbine driven exciter running at 4,500 revolutions per minute.

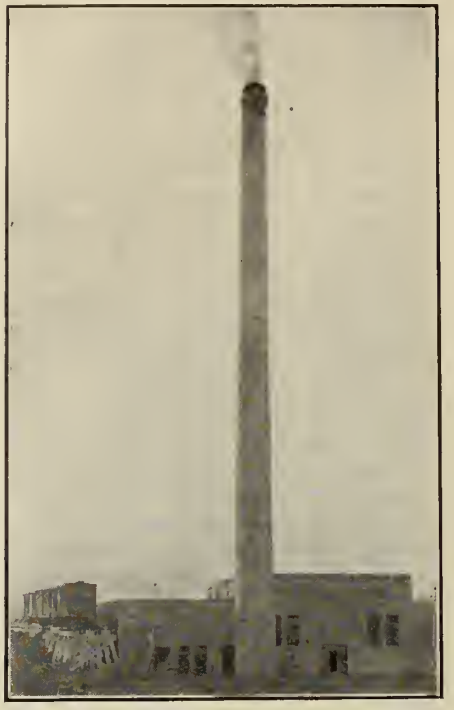
One 20 k.w. motor driven exciter running at 1,200 revolutions per minute.

The switchboard is of natural slate and consists of 21 panels for the different services. All high voltage wiring, oil switches and other apparatus, which

GENERAL VIEW OF INTERIOR OF TURBINE ROOM.

would prove dangerous to the operators, are located on a structure some distance to the rear of the switchboard. There is nothing on the switchboard at a potential above 110 volts. An approved type of voltage regulator maintains constant voltage regardless of load variation.

No outgoing power or light lines can be seen at the station, as the conduits run underground through a tunnel under the main line of the C.P.R. to a distributing tower immediately across the track. Beneath the distributing tower is a small substation containing the transformers for a 12,000 volt line to the Iron Mask mine, about eight miles from the city.



Water Works Section.

The waterworks section of the plant consists of the following:—

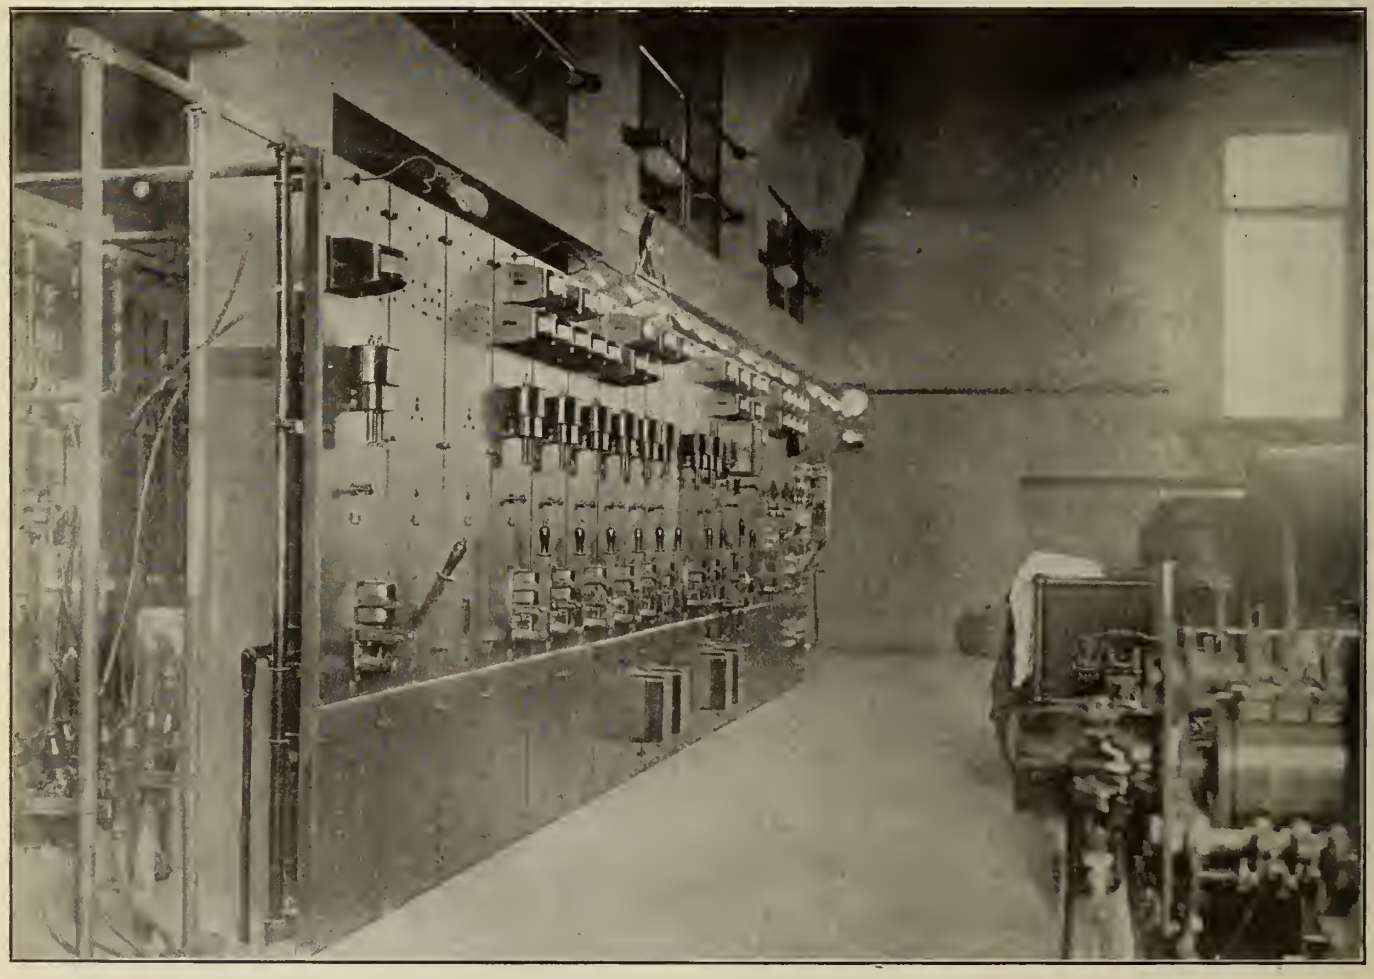
Two induction motor driven Platt pumps working at 1,800 revolutions per minute, and delivering 1,200 gallons per minute.

One Kerr turbine driven pump of the same capacity, the turbine exhausting into a Wheeler waterworks type condenser with Edwards air pump. These three pumps discharge through a Simplex Venturi meter with indicating curve drawing and integrating apparatus to register the water pumped into the city mains.

Directly underneath the pumps is a

EXTERIOR OF POWER HOUSE.

16,000 gallon suction tank, which is kept supplied by two vertical motor driven pumps, located in an auxiliary pump house on the bank of the South Thompson river. Both pumps in the auxiliary pump house are operated from the switchboard, one by a standard hand operated starter and the other by an automatic starter controlled by a float switch. These pumps discharge 1,500 gallons per minute through a 16-inch steel main into the suction tank. From the power house, the main pumps deliver through a 16-inch steel main to a 1,500,000 gallon reservoir, built last year.



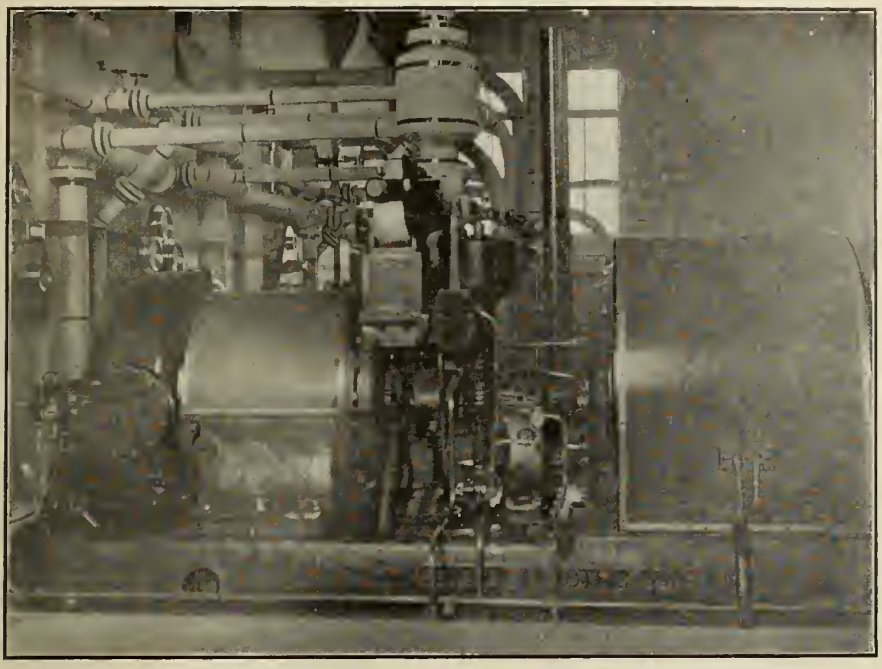
The turbine bay and pump room are served by a 10-ton hand operated travelling crane.

Ashes from the boiler room are handled by a motor driven endless chain conveyer from a hopper on the boiler room level to a distance of 40 feet from the boiler room.

Coal is dumped from an overhead spur into bunkers, from which it gravitates into the boiler room through chutes in the rear wall.

The Barriere Plant.

In connection with the equipment of the Barriere plant, the local station will



VIEW OF NINETEEN PANEL SWITCHBOARD.

be utilized with the exception of the turbines and boilers, the turbines being arranged to run in parallel with or to replace the hydro-electric machines in the event of interruption .

The Chas. C. Moore Co., had the contract for supply and installing the equipment, while the building was erected by the local firm of Johnston & Co. The stack was erected by the Weber Chimney Co., of Chicago.

The entire design and construction was carried on under the supervision of Ducane, Dutcher & Co., consulting engineers.

600 K. W. CURTIS TURBO-GENERATOR.

CAPTAIN FOOTE NAMED TO INVESTIGATE WRECKS.

THE announcement was made a few days ago that Captain James B. Foote, one of the best-known marine experts of our Great Lakes, and manager of the marine department of the Toronto Insurance and Vessel Agency, with headquarters in Toronto, had been recommended by the Dominion Marine Association as their representative on the Commission to be appointed by the Dominion Government for the purpose of investigating marine wrecks and disasters on the Great Lakes.

Captain Foote was the unanimous choice of the members. The captain, who, until a few years ago, was actively engaged in sailing operations, has had a varied and interesting career in all departments of Great Lakes transportation, and his knowledge of shipping, the construction of vessels and other features relative to the qualifications of a marine expert, guarantees his capabilities for the position.

He comes from a family of lake captains, and the representatives of the Dominion Marine Association has every reason to believe that he will receive the endorsation as a member of the Commission by Hon. J. D. Hazen, Minister of Marine and Fisheries. The suggestion for a representative on the Commission emanated from the Dominion Marine Association as a result of the recent disasters on Lake Huron.

FERRY WAR OVER.

THE war between the town of Sarnia and the Port Huron & Sarnia Ferry line is over. The Loughead estate has relinquished the lease of the town dock. Ever since the ferry line placed itself outside the jurisdiction of the town by-law by operating as a passenger and freight line, the town dock has been the bone of contention between the Company and the Town. The aldermen were unable to make the ferry Company pay rent. The ferry line leases from the Loughead estate, and the dock of the estate adjoins the town dock.

To try and settle all trouble, the Town Council some four weeks ago leased the town dock to the Loughead estate at $100 per annum for a period of ten years. Ex-Mayor John McGibbon, who started the ferry war in his tenure of office, stated in a curt, concise letter to the council that it has exceeded its authority in putting through the said lease by not publishing notice thereof in the papers for a period of four weeks. Mr. McGibbon plainly indicated that he was prepared for battle, and the representatives of the Loughead estate, tired of the continual strife, relinquished the lease. The estate will provide a wharf north of the present landing place for the accommodation of the ferry. The cost will be about $2,000.

Hamilton, Ont.—There are few cities in Canada which are going through this period of depression with less trouble than Hamilton. The value of building permits for the year ending October 31st, 1913, was $5,083,050, being a decrease of $299,850 under that of 1912, and an increase of $909,945 over that of 1911. The bank clearings for the ten months ending October 31st, 1913, were $146,724,735, being an increase of $12,291,026 over that of the same period in 1912. The following new factories located during 1913: — The Victor Saw Works, Eversharp Pencil Co., Canadian Mantle & Refrigerator Co., Parkes Construction Co., Hamilton Stereotyping & Electrotyping Co., Furnival-New Limited, Hamilton By-Product Coke Oven, Limited. There were also the following new factories or factory additions erected this year: — Laidlaw Bale Tie Co., Co., $18,000; Steel Co. of Canada, $24,000; Bell Thread Co., $14,000; Fowlers' Canadian Limited, $80,000; Canadian Drawn Steel Co., $3,500; Canada Steel Co., $10,000; Dominion Steel Castings Co., $12,000; Grasselli Chemical Co., $5,000; F. W. Bird & Son, $35,000; Furnival-New Limited, $4,000; Canadian Westinghouse Co., $125,000; Gartshore-Thomson Pipe & Foundry, $5,000; B. Greening Wire Co., $19,000; Hamilton Cotton Co., $6,000; Canadian Cottons, Limited, $28,000; Duncan Lithograph Co., $18,000; Otis Fensom Elevator Co., $40,000; Sawyer Massey Co., $5,000; Boston Insulated Wire Co., $2,000; Lumsden Vinegar Works. $4,500.

Work will be started on the $1,500,000 by-product coke oven plant in the early spring. This industry will have as much effect on the industrial up-building of Hamilton, as the blast-furnaces and steel plants have had in the past. A start will also be made on the $1,000,000 auxiliary steam plant of the Dominion Power and Transmission Co. A number of the new factories that have been negotiating with the industrial department are expected to have arrangements completed by the Spring.

The Sydney Foundry and Machine Works, Ltd., have just passed the most successful year in the history of their business, and indications point to an even larger expansion during 1914. In the past twelve months, the Company, under the efficient management of W. E. Clarke, have completed their programme of plant extension made public a year ago, and the plant is now one of the most up-to-date structural shops in the East.

Geometrical Progression in its Relation to Shop Practice

By John Edgar

The accompanying article is one full of interest to machine tool operators, and, being written in a simple, practical manner, cannot fail to make effective appeal, particularly on account of the widespread concentration of effort put forth to secure maximum quantity and high degree quality output.

IN these days of high speed steels and the modern rush of affairs in the machine shop, where every minute is made to count, the relations of speeds and feeds are of vastly greater importance than was the case in the old days of carbon steels and lax shop methods.

Many shops now have a speed boss, whose only duty it is to see that the work and tools are being run at the most efficient speed as deduced from the experience of past effort on any particular line of work. It is part of the scheme of modern shop management, so-called scientific management. The order of things in a shop so run is to make every move count. In fact, this system of planning every move of the operator is carried to the extreme in many shops, and operator only he really becomes in such a plant, since his work is all schemed out, leaving to him only that which requires muscle and brawn. Cases where the scheme is carried to such an extreme are, however, rare, it being only in shops of large size that these luxuries are found.

The machinist in the small shop can, however, adopt to a large degree such methods in his own particular case and profit by the experience. By planning the job before he commences, laying out a line of operations that are necessary, and carrying these out, he not only gains in experience as an executive, but begins to see wherein methods can be improved and time saved, all of which he could not note if he just takes the job and starts in on the operation that comes first into his head and seems handiest.

Not that the better class of machinist—those who are not machinists long, but who rise—works on such a schedule, because he uses his head a little before jumping in on the job. He always knows that he is right before he proceeds. In this way he accomplishes the same object as those highly systematized shops with their speed bosses, planners and production men; in other words, he does his own thinking, and gets paid for it. To a man of this stamp the relation of speeds and feeds of work and tools is one of great importance, and anything written on this line is sure to be of interest.

Speeds and Feeds.

As manufacturing competition becomes more keen and the profits narrower, the manager must avail himself of every item that will add to the gain column, and must look for every item, no matter how small or trivial which spells loss. In selecting his machinery he is continually on the watch for new ideas that will save a few cents in the manufacture of a part. For this reason a great deal of study has been put into the modern machine tool to aid the operator in getting out a maximum day's work.

It is only in the last few years that any great attention has been paid to the lay-out of speeds for the lathe or milling machine in order to get a graduated progression of speeds and feeds. In most of the older designs the speeds when jumping from open belt to back gears left a large gap or more often overlapped several speeds without uniformity. It was only when study was put into the problem that we began to get machines in which the speeds ran from lowest to highest with even steps.

There has been a lot of discussion on the subject of what is the proper progression of steps in speeds and feeds, and by using a simple line of reasoning we may come to a tolerably correct attitude on this important question.

Lathe Example.

Using the lathe as an example, let us suppose that we have five pieces of work to turn, the diameters being 1 in., 2 in., 5 in., 10 in., and 20 in. respectively. In order that the surface speed be the same in each case, we must revolve the one-inch piece twice as fast as the two-inch piece, because the circumference varies directly as the diameter—that is, the length around the one-inch piece is only one-half that around the two-inch piece. The five-inch piece would revolve only one-fifth as fast as the one-inch piece; the ten-inch piece 1-10, and the 20-inch but 1-20 as fast.

We have seen that the addition of one inch to the diameter of the one-inch piece reduces the speed 100 per cent. If we add one inch to the two-inch piece we reduce the speed 50 per cent., and similarly one inch added to the 5 in., 10 in., and 20 in. pieces reduces speed 20, 10 and 5 per cent. respectively. From this, we see that the speed must vary inversely as the diameter for any given surface speed. It also shows that the speeds vary by small increments at slow speeds, the increment or step gradually increasing as the speeds increase.

Speeds in accordance with the rules of geometrical progression fulfil the requirements of the above conditions.

Application of Geometrical Progression.

If we multiply a number by another number and then multiply the product by the same number and repeat the process a number of times we have in the first number and the succeeding products a series of numbers that are in geometrical progression. Thus 1-2-4-8-16-32 and 64 are all in geometric series, the common multiplier being 2, which is the ratio of the series.

From the foregoing we would expect to find the speeds on a 10-inch engine lathe, with 5 steps on the cone and single back geared, ranging from 21 to 458 revolutions per minute, as tabulated below:

	Open Belt.	Back Geared.
Step 1	548	82
„ 2	325	58
„ 3	230	41.4
„ 4	163	29.4
„ 5	116	20.8

The percentage of increase between the steps is 29 per cent., and the geometric ratio is 1.41.

Milling Machine Example.

The same line of reasoning in favor of the geometrical progression of speeds may be taken in the case of the milling machine. In this case the rotative speed of the cutter is the factor to discuss, and, since these are cylindrical in shape, the increase in speeds follows the same reasoning, and must, therefore, follow in the geometric series. In a milling machine with double back gear and arranged with two counter-shaft speeds ahead, we would expect to find the obtainable speeds arranged in the progression tabulated below:

	OPEN BELT		SMALL RATIO BACK GEARS IN		LARGE RATIO BACK GEARS IN	
Cone	Fast Counter	Slow Counter	Fast Counter	Slow Counter	Fast Counter	Slow Counter
Step 1	223.0	129.0	74.4	43.0	24.85	14.4
Step 2	186.0	107.0	35.8	35.8	20.7	12.0
Step 3	155.0	89.4	51.6	29.8	17.25	10.0
	1.0	2.0	3.0	4.0	5.0	6.0

This gives, with a 3-step cone, double back gears and two counter-shaft speeds,

18 changes of speed in a geometric series of 1.2 (approx.) ratio. The arrangement of the steps and the method of changing counter-shaft speeds after the three steps of the cone have been utilized give us a flat cone, or, in other words, one in which the difference between the large and small steps is not great; the difference between the two counter-shaft speeds being 223 and 129, a ratio of 1.725 to 1.

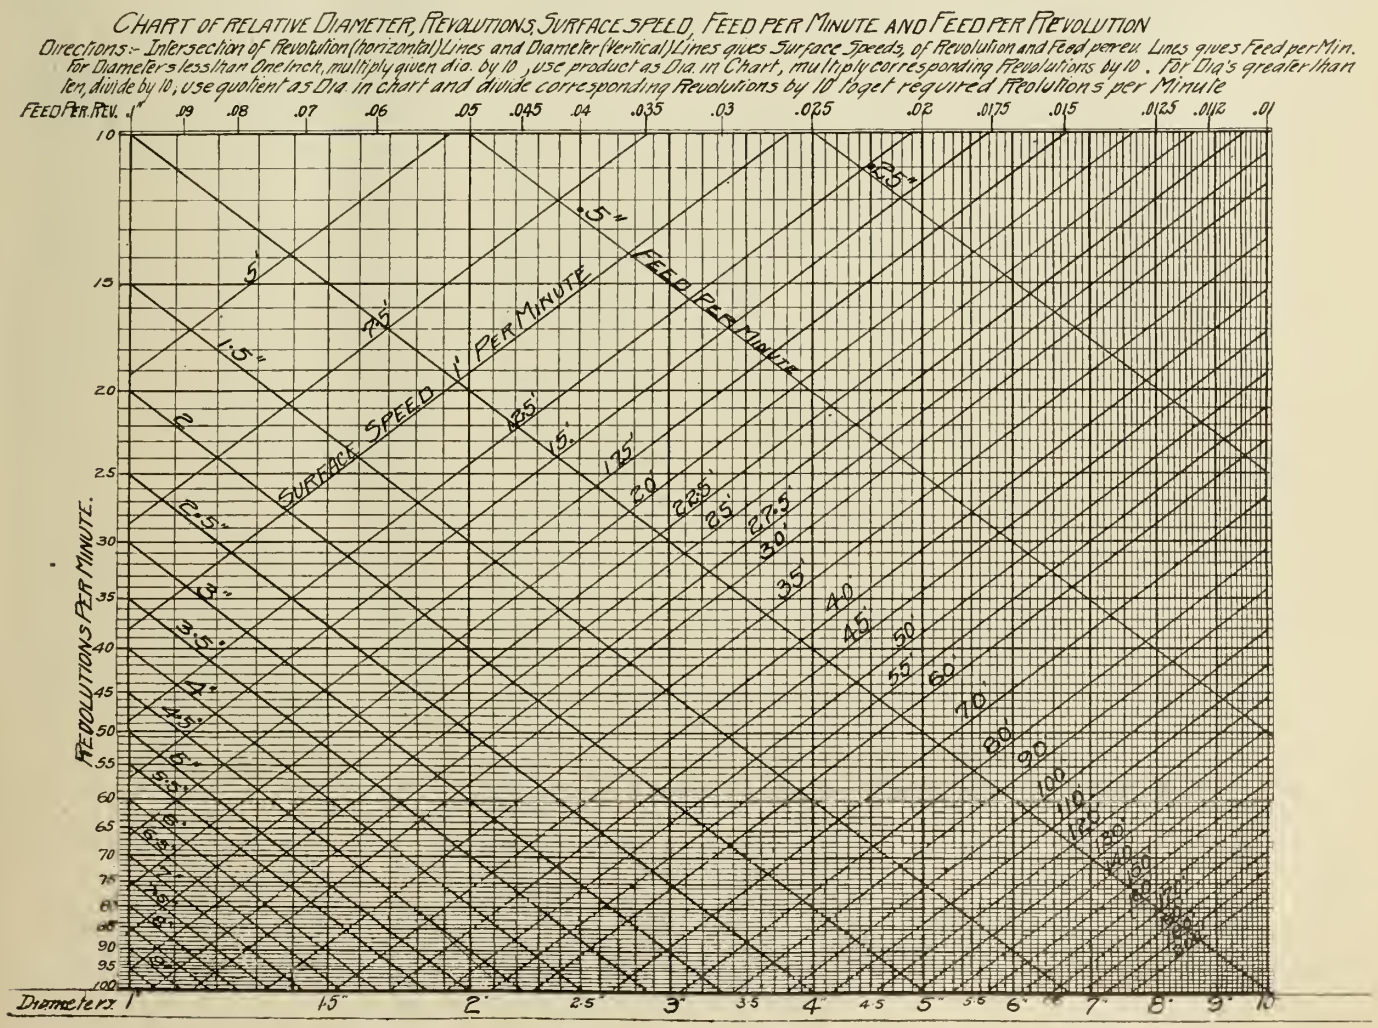
Some drives on milling machines are laid out so that the change in counter-shaft speed is made between the shift of the belt from step to step on the cone; the speeds for such a drive being as follows:

Cone.	OPEN BELT Fast Counter Speed	OPEN BELT Slow Counter Speed	SMALL RATIO GEARS IN Fast Counter Speed	SMALL RATIO GEARS IN Slow Counter Speed	LARGE RATIO GEARS IN Fast Counter Speed	LARGE RATIO GEARS IN Slow Counter Speed
Step 1	223.0	186.0	74.4	62.0	24.85	20.7
Step 2	155.0	129.0	51.6	43.0	17.25	14.4
Step 3	107.0	89.4	35.8	29.8	12.0	10.0

The difference in the large and small steps of the cone are greater in this drive, but the counter-shaft speeds are nearer together, and have a ratio of only 1.2 to 1. They are 223 and 186 revolutions per minute.

The former type of drive has the greater popularity, and is no doubt the better when all things are considered, because the belt surface on the cone is larger, giving greater power.

Summing up, we may say that for machine tools where the work or tool revolves as in the lathe, milling machine, boring mill and drill press, the speeds should be arranged in geometrical progression to obtain the best working condition, and that the ratio chosen must depend on the range and size of the machine.



Relationship of Successive Feeds.

In what relation should the successive feeds stand to one another?

Take the case of the lathe again. Here we have the work revolving and the tool advancing at a steady rate per revolution. Now, should the feed be held at the constant rate per revolution of the work for all diameters or should it vary accordingly? In other words, should the feed be 1-32 inch for turning a 1 in. piece, and be ¼ in. per turn for an 8 in. diameter, or should it be 1-32 in. for the 8 inch piece also?

Let us take three pieces of work, 1-2 and 3 inches in diameter. We turn these pieces at 76.4, 38.2, and 25.5 revolutions per minute respectively, so that we have a surface speed of 20 feet per minute. If we fix the feed at 1 inch per 20 feet of surface, we would have feeds of 0.0131, 0.0261 and 0.0392 inches respectively per revolution of the pieces. Here the feed increases with the diameter of the work, but is constant at 1 in. for every 20 feet of surface that passes the tool, giving an even and equal chip for each case. If we assume a constant feed per revolution, we would have 2.385, 1.193 and 0.796 inch as the respective feeds, and the chip would evidently be greater on the small diameter than on the large.

From this we may take it that the feed should be constant for every foot of surface that passes the tool for like conditions irrespective of the diameter of the work. It will be found that there is a constant ratio between the three

GEOMETRICAL PROGRESSION IN ITS RELATION TO SHOP PRACTICE.

same reasoning we may find that the feeds should also be arranged in geometric series for all machines of the rotative type, as lathes, milling machine, boring mills and drill presses.

Feed Arrangement Systems.

There are now two systems of feed arrangement in use in the milling machine:

The Dependent System.—In this, feeds are obtained by mechanism connected to the spindle of the machine, and any change in the rates of speed of the spindle changes the feed per inch in the same proportion. For this reason it is necessary to provide a range of feeds sufficient to cover the full range of conditions for each spindle speed. This necessitates a ratio of about 100 to 1 for the feeds, and in order that the step between any two feeds may be small enough to be of use, the actual number of feeds must be great. As a result, we have machines on the market with as many as 30 feed changes. This is not the case with the other and later system.

The Independent System.—This independent system is, as the name implies, that in which the feeds are independent of the number of revolutions of the spindle, and any rate of feed per inch is available for use with the whole range of spindle speeds without change. For this reason the ratio of the fastest to the slowest feed is necessarily much lower, and is actually but 30 to 1. This arrangement is only possible with the so-called "single pulley drive," in which the changes in both speeds and feeds are made entirely through two distinct and separate mechanisms driven from one constant speed pulley.

Speed and Feed Combination Considerations.

The question of proper combination of speed and feed to obtain the greatest amount of output is one which is difficult of solution, and can only be solved for any set of conditions; each and every case having a different combination into which the quality of finish, the material used, the material of which the tool is made, the type and rigidity of the machine and a certain immeasurable human element enter to complicate matters. The only correct combination that will give the best results is found from experience.

The Chart Purpose.

To aid the choice of the proper speed for any diameter to give a certain surface speed, the chart is given, in which will be found the surface speed, the diameter and revolutions per minute for a wide range of conditions.

To find the proper number of revolutions at which the work should run, trace the diameter down the vertical line to the intersection with oblique line representing the surface speed; the horizontal line through this intersection represents the revolutions per minute to the scale at the left. Thus, a piece of work 6 in. in diameter to run at 45 feet per minute should revolve 29 turns per minute.

The range of the chart is unlimited, except as to surface speeds, of which a wide range are incorporated. Thus, what speed should a ½ in. cutter turn to give 30 feet per minute at the periphery. This being less than one inch, take the chart to read 100th inches where inches now show, and we have the intersection of the surface speed and diameter lines at about 23 on the left hand scale, but as the diameter is only one-tenth, the revolutions must be ten times the scale, giving us 230 r.p.m. as the required speed.

The chart also gives the feed per revolution and feed per minute for any given revolutions per minute, so that we may obtain the revolutions per minute and the feed per revolution for any given diameter, surface speed and feed per minute. As an example, take a cutter 3 in. in diameter working at 45 feet per minute and a feed of 3 in. per minute. The required r.p.m. are 57, and the feed per revolution .0675 inches.

This chart will be found very handy, and when accustomed to reading it, which is very simple, will save a lot of time.

THE L. S. STARRETT CO. TO THEIR EMPLOYEES.

LAST December, after twelve months of steady increase in our sales over the business of the corresponding months of the year before, we took pleasure in notifying you of a vote of the Directors to pay to each employee a sum equal to two per cent. of the total wages paid him during the year, which, for those who had worked here the full year, meant about one week's extra pay.

The conditions at this time are somewhat different. The sales for the first six months of the year showed a gratifying gain over the corresponding months of last year, but the business of July and the following months has been less than it was in the corresponding months of last year. The decrease in business the latter part of the year is in keeping with the general depression throughout the country following the change in administration and the passage of a low tariff law, but fortunately we have not felt the effects of this depression nearly so much as many others, especially those in the machine tool line; and in fact, in spite of somewhat decreased sales we have not been able to bring our stock of goods on hand up to the condition it should be in, to meet the heavy demands on it which we are confident the early spring trade will bring.

The continued harmony and co-operation between all parts of our organization is very gratifying to us. It is gratifying that this idea is becoming more firmly rooted in the mind of each employee—that Starrett Tools must be right, and that everyone of us has his part to do in making and keeping them right; that economy in production and the elimination of waste in material, time and labor are to be constantly striven for; but that the one great essential in the making of Starrett Tools is quality.

At this Christmas time we wish you all happiness, and take pleasure in informing you that at the meeting of the Directors of this Company held on the 10th instant, a vote was passed similar to that of last year, namely, that this Company pay, as soon after the first day of January, 1914, as practicable, to each person in the employ of the company on that date, a sum equal to two per cent. of the entire amount of wages paid to such employee during the year 1913.

SKINNER CHUCK CO. BANQUETS EMPLOYEES.

IN these days when there is so much talk about capital oppressing labor, it is quite refreshing to find an instance where the labor and capital meet on the friendliest of terms and partake of the same food from the same table. That is exactly what happened on the night of December 23, when the Skinner Chuck Co., New Britain, Conn., tendered its annual banquet to its employes at the New Britain club. There were 120 men present and Professor David N. Camp, President of the Company was the principal speaker and the honored guest of the evening. Mr. Camp will soon pass his ninety-fourth milestone, a fact that made the presence of this venerable gentleman the more notable. The following invitation was sent out by the Company, and most of the recipients accepted:

"You are cordially invited to be present at a dinner for the employes of the Skinner Chuck Company at 7.30 o'clock at the New Britain Club. It is hoped every employe will be present. Wishing you a merry Christmas and a happy New Year; very truly yours, the Skinner Chuck Company."

Ovation for Guest of Honor.

When Mr. Camp entered the banquet hall he was given a rousing welcome and for several moments the cheers of the diners rang throughout the outer corridors. Deacon Camp was greatly touched by this demonstration of affection and controlled his emotions with difficulty. Secretary E. J. Skinner was toastmaster, and those who responded to toasts were Superintendent A. A. North, Harry Hancock, Joel Bloomquist, Treasurer D. O. Rogers, Joseph Preissel and others. Throughout the evening Lynch's orchestra furnished the music.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

REORGANIZING THE BELTING DEPARTMENT OF A MACHINE SHOP.

By H. Womersley.

ABOUT three years ago I took charge of a machine shop and was told that any improvements I wished to introduce would be welcomed. I can assure you there was plenty of scope. The belting was in a deplorable condition, so I decided to tackle it first, and what follows is an outline of how I proceeded to bring this important equipment to a proper state of efficiency.

I entrusted the care of all belts to one man and held him responsible for all repairs, alterations and dressings. Notices regarding this were posted throughout the shop. The belt man was supplied with the necessary tools, which consisted of clamps and rods, belt scraper, knife sharpener, awl, drive punch, blind punch, staple puller, pegging hammer, brush for compound, etc.; also a compound for preserving leather belts made from the following:—Two quarts castor oil, 1 lb. tallow, 1 oz. powdered resin, 2 oz. hard soap, melted and mixed together.

I next instructed him as to how I wanted the belts repaired and cleaned, and informed him that he must make a careful inspection of all belts at frequent intervals and keep a record of same. His inspection must cover such points as general condition, whether overdry, or saturated with oil; whether any laps had begun to start open, or whether a belt needed early replacement.

If the belt were dry or harsh he was to first clean off the surface dirt, this being accomplished by means of a cloth, damped in kerosene, if need be. In bad cases, the belt was to be scraped; the ideal aimed at being a clean leather surface. A light application of dressing was to follow. For greasy belts, wiping on the pulleys with a dry cloth or some absorbent material would help, but, if possible to remove the belt, packing in dry sawdust or shavings was recommended for the purpose of absorbing the oil. An excess of oil, it should be explained, tends to rot the leather.

Jointing Belts.

I next instructed him on jointing belts, and as I have a fancy for the "hinge" style, I showed him how to make that joint as follows:

Cut the ends of belt to be joined perfectly true with a tee square.

Punch two rows of holes in each end of the belt, care being taken that the holes are not opposite each other, and that one of the ends contains one more hole than the other.

No hole should be less than ½ in. from the edge of the belt, and no nearer than ¼ in. to the end. The second row must be 1 in. from the end alternate with the first row. A good rule is as follows:—

2 in. to 2½ in.	3 holes.
3 in. to 4 in.	5 "
5 in.	7 "
6 in.	9 "
8 in.	13 "
10 in.	15 "
12 in.	17 "

Width of Belt Lacing.

Up to 5 in.—¼ in. and 5-16 in.
6 in. to 14 in.—⅜ in. and ½ in.
14 in. and over.—⅝ in.

Begin to lace by drawing half the lace through the centre hole. If you commence with the upper end of lace, pass it over the one, and under the other end of belt, and continue in this way, over and under until the last hole is reached; then fasten your lace in the usual manner. When you commence to lace with the lower half of lace, follow same method, except that you pass the lace under the one and over the other end down through the hole from the opposite side of belt. Both sides of belt show lacing to be alike. This plan of lacing produces pliable joints.

Next avoid putting on belts too tight. The proper tension is of fundamental importance. If too tight, there is a large unnecessary loss of power from excessive friction. On the other hand, if too slack, the belt is liable to flop around and jump off the pulleys when a load is suddenly thrown on and off.

I also pointed out to him that single belts should be put on to run with the grain or hair side, next to the pulleys, and so that the joints of the laps run against the pulleys, as the laps on the outside of a belt are most liable to come apart when the joints are run against the atmospheric pressure. Double belts should be put on so that the points of the laps run with the pulleys, as both sides point in the same direction.

Belting Rules.

I wrote him out the following rules regarding belting:—

To find the Velocity of Belting—Multiply the diameter of the pulley in feet by 3.1416, and again by the revolutions of the pulley.

To Find the H.P. of Belting—Multiply the velocity by the width of the belt in inches, and that product by 50 for single, 80 for double, and by 100 for three ply. Divide this product by 33,000 and the quotient will be the H.P. which a good belt can safely transmit.

To Find the Width of Belting—Multiply the given H.P. by 33,000, and divide this product by the product of the velocity multiplied by 50 for single, 80 for double, and 100 for three ply.

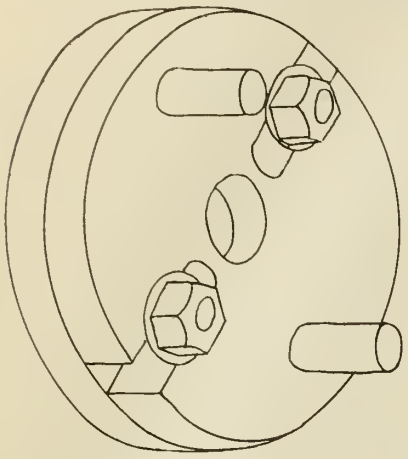
To find the length of belts when it is inconvenient to use a tape:

(a)—When both pulleys are of about the same size. Add the diameter of the two pulleys together; multiply this result by 3.1416, and divide by 2. To this quotient add twice the distance between centres of the shafts, and this will give the required length.

(b)—When one pulley is considerably larger than the others. Square the distance between the centres of the shaft; add to this the square of the difference between the radii of the two pulleys, and from this total extract the square root and multiply by 2, thus acquiring the total (M). Add the diameters of the two pulleys together and multiply this total by 3.1416, then add to one-half of this result the total (M), and you get length required.

(c)—For cross belts.—Square the diameter of the large pulley and the distance between centres, add together and extract square root. Square the diameter of the small pulley and the distance between centres; add together and extract square root.. To the sum of the two roots, add one-half the circumference of the two pulleys, when the total will be the required length.

I must confess here that this beltman turned out to be a very good man, for after this system had been in operation two years, the principal of the firm made this statement to me:

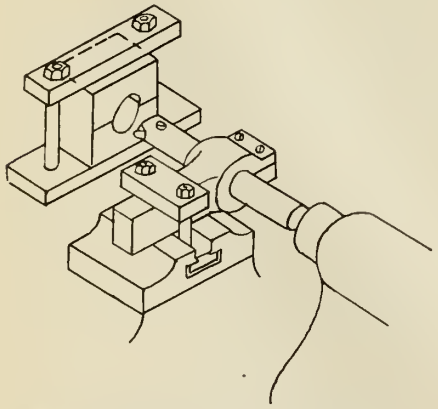


Your system of belt repair is a great success, because it minimizes machine stoppages, the leather bill is going down, less repairs seem to be necessary to shafting, also, the appearance of belts repaired in a uniform manner is not an eyesore as formerly.

TWO LATHE KINKS.

By J. D. Cooper.

IT is acknowledged by all good lathe men that for accurate turning on nice work it is better to have it driven from each side by two-tail dogs, and to be sure that each end drives an equal amount.



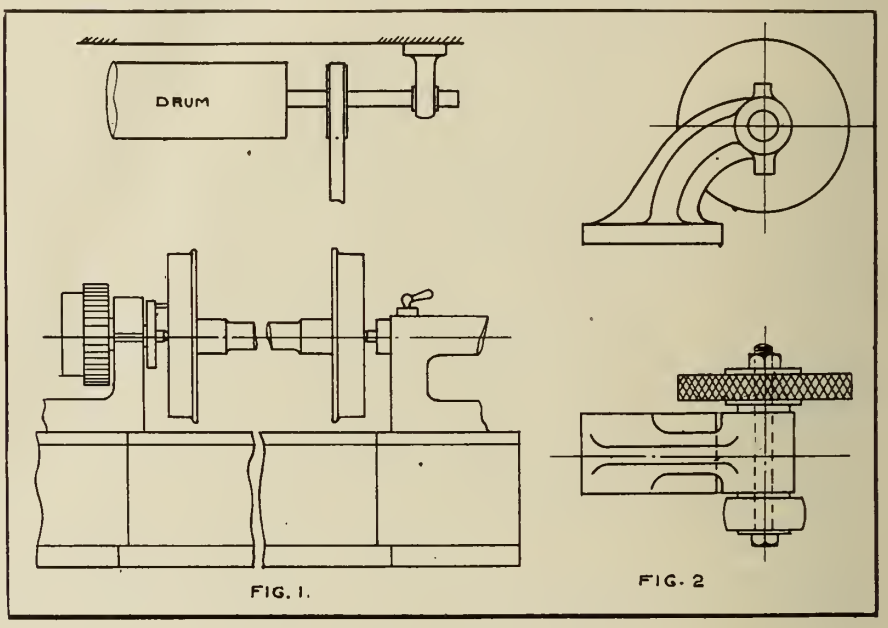
One of the best methods of insuring this is to use what is known as the equalizing face plate, Fig. 1. This consists of an additional plate on the regular face plate as shown, and held to it by the two studs

EQUAL DRIVE FACE PLATE.

working in the slot in the outside plate. The lathe centre comes through in the usual way, and the outer plate is left loose enough to adjust itself, so that each of the driving studs (A) and (B) will bear with equal pressure on the two ends of the dogs. This insures an even driving pressure and avoids the tendency to crowd the work to one side, which is sometimes found where the bent-tail dog is used, or even the single straight-tail.

One of the essential features in using the boring bar in the lathe is to have the bar supported as close to the cutting edge as possible, and Fig. 2 shows a method which is used by some tool makers with considerable success. To begin with, the work is clamped to an angle plate fastened to the face plate, so that it can be clamped perfectly square with the latter, and not sprung, as is sometimes the case when we attempt to pull the work back against the face plate by two or more bolts.

USING BORING BAR IN LATHE.



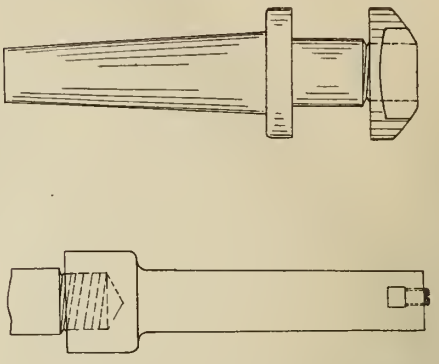
As shown, the boring tool (A) is clamped in the holder (B) so that the tool block and carriage travel with the bar when fed into the work by the tail spindle (C). In some cases the tail spindle is not used for this purpose, and the bar is fed into the work solely by the carriage. Another way which is advocated by many lathe men is to move the holder (B) as close to the work as possible and feed the bar (A) through it by the tailstock (C), as this keeps the support close to the outside of the work at all times. On the other hand, it allows the tool to spring more as it gets farther into the hole, for the cutting point is constantly going away from the support to the bar, while if it be clamped in the holder, the cutting point is at a constant distance from its support at all times, so that the spring of the bar should be practically constant.

TRUCK WHEEL AXLE GRINDING.

By "Beechmount."

GENERALLY, when truck wheels come into the shop to be trued-up, we find the bearing on the axle out of true. The amount of material to come off is, however, so small that grinding is the means usually adopted. A difficulty arises when the truck wheel lathe is not adapted "as regards speed" for trueing-up the bearings.

To overcome this, rig-up an arrangement as indicated by Fig. 1, throw off the machine driving belt, drive off pulley to wheel, and use grinder as shown in Fig. 2 to true-up axle.



TRUCK WHEEL AXLE GRINDING.

STUB ARBORS AND BORING HEAD.

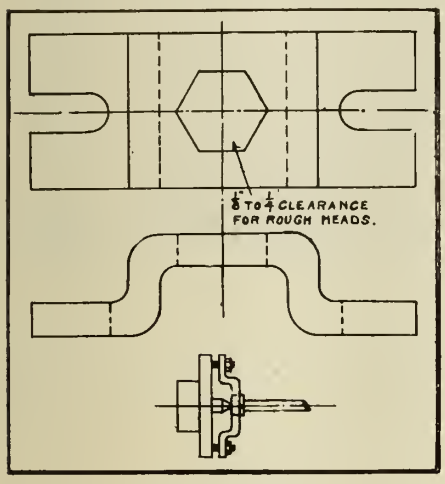
By D. A. Hampson.

FOR a goodly proportion of milling work, both manufacturing and jobbing, the usual full length arbor has its disadvantages. The class of work, which is produced by a single cutter or a few cutters in a compact cluster, and which is of a form that can be set well up toward the head of the machine, may be performed as well and better by using a short or stub arbor.

STUB ARBORS AND BORING HEAD.

The advantages of a stub arbor are that fewer collars have to be removed and set every time a change of cutters is made, the absence of a tailstock to set each time and to keep lubricated, the space for work pieces, jigs, and clamps which the short arbor permits, and the general freedom with which work may be handled when the long arbor and its support are dispensed with. All of these make for increased production and decreased cost.

If the cutters are provided with keyways, and all cutters should be in these days, the nut at the end of the arbor can be made very narrow, if the work demands it, a nut of but two threads being sufficient to hold the cutters together properly. Several lengths of stub arbors are handy to have on hand. For a 1-in. arbor, length of 1 in., 2 in., and 4 in., are most useful, while special arbors for special jobs might well exceed these sizes.



Milling Machine Tools.

In connection with stub arbors, a convenient boring head may be devised as illustrated. This has an enlarged end which is threaded out to fit the nut end of the arbor. It carries at its free end a fly cutter set square or on an angle as desired. Such a boring head is inexpensive, quickly applied, and reasonably stiff. Not infrequently, we encounter a piece of work that has to be milled and bored at a single setting. This stub arbor and boring head combination will do many such jobs without removing the arbor from the machine and do them as well as much more expensive tool outfit.

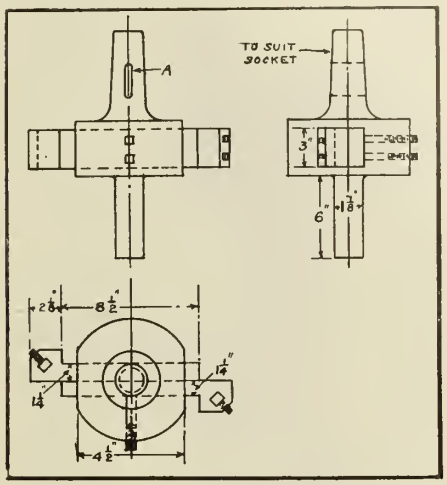
BOLT DRIVER.

By H. W.

THE sketch shows a very efficient bolt driver, due to the fact of the bolt being easily and quickly removed. The

BOLT DRIVER.

driver adjusts itself to the head of the bolt and also keeps the lathe balanced when running at high speeds. A variety of size is, of course, necessary to suit particular bolts.



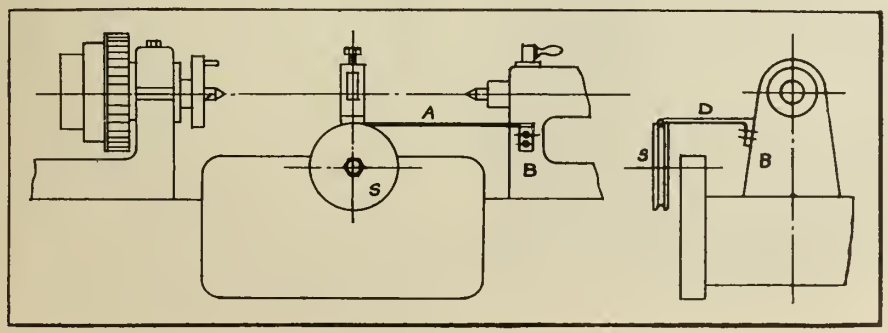
TAPER TURNING ARRANGEMENT.

By W. Womersley.

WHEN the lathe has no special taper turning arrangement, the rig here described and illustrated can be readily applied. The handwheel is removed and replaced by a hardwood disc (S), with a run groove for a stout cord (A). One end of this cord is attached to the tailstock at (B) by means of a bent metal strip D. The conicity or degree of taper will be determined by the diameter of the disc (S).

BORING ADJUSTABLE CUTTER HEAD.

THE cutter head here illustrated is a simple and strong tool for producing 6 in. to 16 in. holes from the solid after



BORING ADJUSTABLE CUTTER HEAD.

drilling the guide hole. This method permits the use of short and rigid tools. It is generally advisable to help the drive with a cotter at (A), as great pressure is put on the shank when cutting out 16-inch holes.

MOVING HEAVY OBJECTS.

By D. S. Mann.

IN moving heavy materials, such as machinery, marble, etc., where rollers are used on wooden timbers, the rollers are found to sink into the wood slightly and often sufficiently to practically prevent the movement. Where a block and tackle is used for pulling, it will often be found that the object will slide on the rollers before they will turn. In such cases it will greatly expedite matters if a pipe wrench is put on each end of the roller and used to propel the same. The results will be surprising and two men with ordinary pipe wrenches can walk a tremendous load up a good incline without any trouble. Of course, some means should be provided to hold the load. The rollers having such a short radius, the leverage gained is great and the action is the same as that of a self-propelled vehicle.

TAPER TURNING ARRANGEMENT.

SITE BOUGHT FOR DRYDOCK.

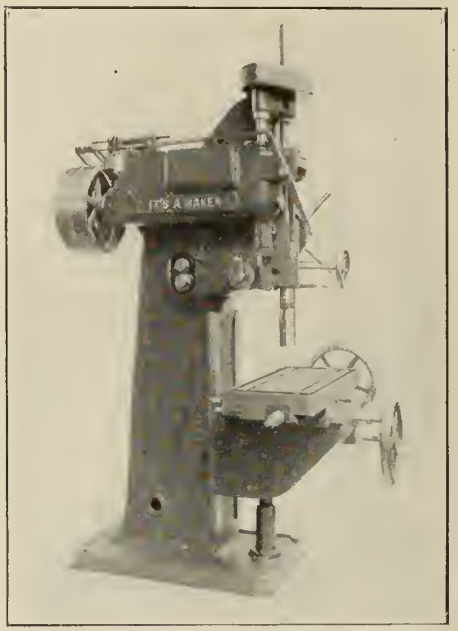
THE Government has purchased from the Bullen Marine interests on Lang's Cove, Esquimalt, B.C., a site for the Government drydock for the Pacific Coast, as promised some months ago. The plans for the drydock are now being prepared by the Public Works Department engineers, and it is expected that tenders will be called for early in the spring.

The estimated cost of the drydock is approximately four million dollars. It will be of the same dimensions as the new Government drydock at Levis, now under way, and will be capable of accommodating the largest vessels afloat. The dimensions are: Length, 1,150 feet; depth, 40 feet, and width, 120 feet. It is understood that a similar drydock is to be built at Halifax.

The building of these three drydocks will meet a long-standing need in Canada for ship repairing facilities both on the Pacific and Atlantic coasts, and will lay the foundation for the resuscitation of the Canadian shipbuilding industry. Moreover, the policy of constructing big Government drydocks on both coasts is in line with the needs of a Canadian naval defence policy along the lines of the Naval Service Act of 1910. Towards the ultimate adoption of this policy the Government is being steadily compelled by the force of national opinion and by the logic of international developments.

The drydock proposals, with a strengthening of the coast defences at Halifax and Esquimalt, are likely to be the Government's only practical move towards naval defence during the coming session.

C. P. R. Apprentices.—The annual presentation of scholarships in connection with apprentice instruction classes at the Winnipeg C. P. R. shops took place in the schoolroom on the afternoon of Tuesday, Dec. 23. There were over one hundred apprentices present. R. A. Pyne, superintendent of shops, presided, The company grants five free scholarships annually, and these are keenly competed for by the apprentices. The winners for this year were: Thomas Howe, apprentice blacksmith; Donald Chapman, apprentice machinist; Harry Waller, apprentice machinist; Charles Powles, apprentice machinist; Ralph Wade, apprentice coach carpenter.



DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

HIGH SPEED DRILL.

THE three photographs show the construction of a high speed drill, ball bearing, built by Baker Brothers, Toledo, Ohio. The machine is styled No. 1-B. The speed changes are obtained through hardened sliding gears mounted on ball bearings. This ensures a great durability and at the same time high efficiency. It may be noted that in securing the desired six speeds there are no idler gears running, only one pair of gears being in mesh in the gear box at any one time. The minimum number of gears in mesh at one time not only increases the efficiency of the machine materially, but gives long life and durability, which is essential, as the punishment received in the hands of the average drill press hand is severe.

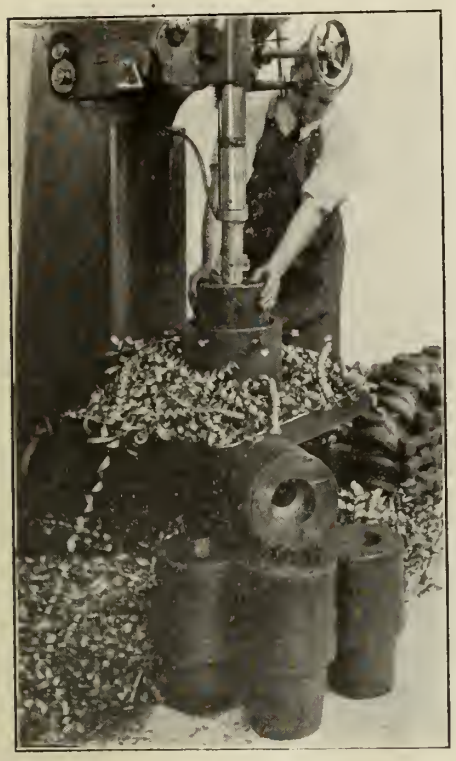
Two of the photographs show the machine in operation on actual work. In one view, it is shown with a plain table drilling a 2½ in. hole through a hammered steel forging 14 in. long. A 1⅛ in. hole was first drilled through the forging. The 2½ in. hole was next drilled, taking five minutes. The hole was then enlarged to 4 in. diameter, 4 in. deep, the time required being 4½ minutes. The other photograph shows the machine drilling drop forged iron saddles with 2½ in. hole, 2¾ in. deep. These were drilled in 37½ seconds.

BALL BEARING HIGH SPEED DRILL.

DRILL IN OPERATION.

The compound table with screw adjustments is a feature worthy of note, the adjustments being smooth, rapid and positive. Another feature of interest in this machine is the speed range. This as nearly as possible corresponds to the proposed "chromatic scale" of speeds being advocated by some of our noted efficiency engineers.

All gears in driving train except large top driving gear are of steel, oil treated and hardened. They run in bath of oil, and are protected by suitable guards. The spindle is made from high carbon, hammered spindle steel forgings, and the thrust is taken on high duty ball bearings. The spindle has six speeds:—500-369-258-179-130 and 92.5, any one of which may be obtained instantly by means of sliding gears controlled by one lever within easy reach of operator. These are in dive keys or tumbler gears in driving train. The shafts are mounted on high duty radial bearings, all enclosed in an oil-tight case.



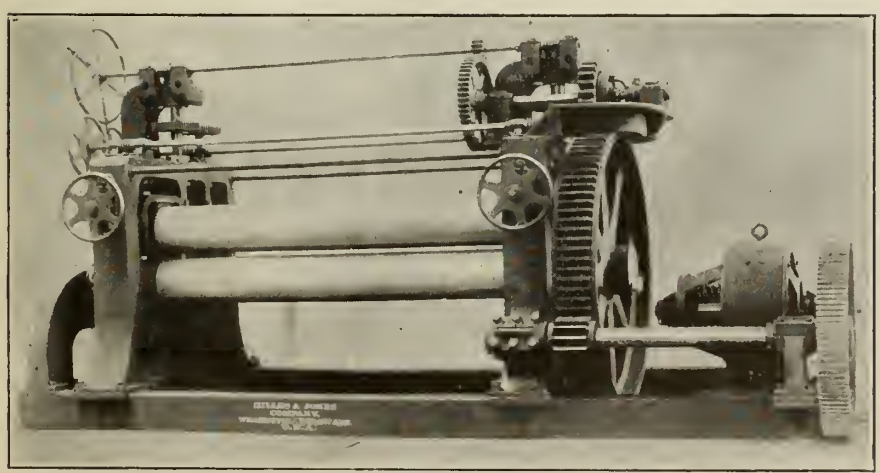
The spindle has vertical feed of 16 in. and is equipped with depth stop. There are twelve changes of feed per revolution of spindle as follows:—.006, .007, .008, .010, .012, .013, .015, .017, .020, .024, .028, .032 inches, all obtained by means of powerful dive-key and quick change slip gears. A safety device on spindle feed shaft is provided to protect feeding mechanism from injury, and to provide uniform wear of large worm gear.

The plain table, 24 in. x 29 in., is of box knee type, heavily ribbed, and screw elevating.

The compound table is also of box knee type, heavily ribbed, with screw adjustments in all directions. Micrometer collars are provided for in and out, and cross movements. With the screw adjustments, it is not necessary to lock the tables in position after adjustments have been made. Fine adjustments can also be made, at the same time being very rapid. The size of the compound table is 16 in. x 36 in.

The swing is 24½ in., i.e., 12¼ in. from centre of spindle to column. Provision is made for a 3 in. single belt

drive running on an 18 in. diameter pulley. at 475 r.p.m. direct from line shaft. For motor drive, a 10 h.p. motor is placed on the floor directly back of machine, no alterations being required for

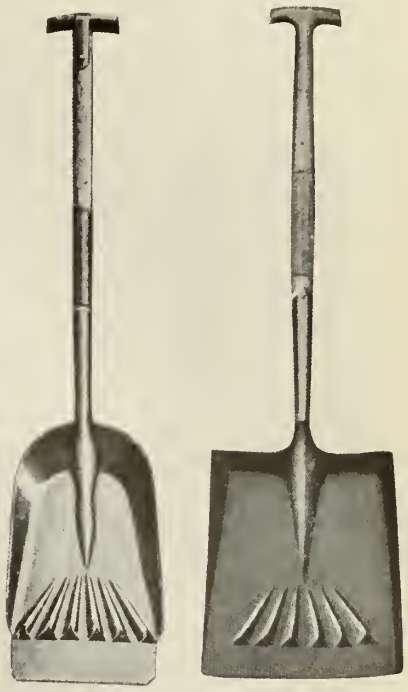


DRILL IN OPERATION.

changing to the latter except the belt shifter. An oil pump of proper size, complete with tank and all necessary piping, is included in the equipment.

LARGE PLATE STRAIGHTENING MACHINE.

THE accompanying illustration shows what is considered to be the largest plate straightening machine ever built. It can straighten cold plates of 3½% nickel steel, 1⅜ inches thick and 10 feet wide. The motive power is a 100 h.p. Westinghouse motor. Hilles & Jones Co., Wilmington, Del., are the manufacturers of this machine.



LARGE PLATE STRAIGHTENING MACHINE.

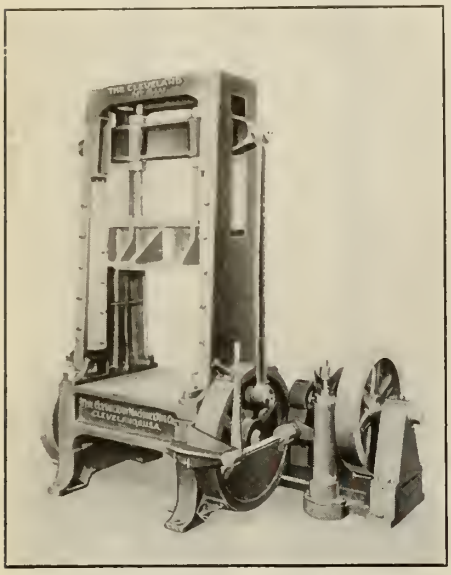
SPRINKLING SHOVEL FOR BOILER FIRING.

IN the December, 1913, issue of The Power House there appeared an article, entitled "Improved Hand Firing," the substance of which was the adoption for steam boiler firing purposes of a special type shovel designed to sprinkle the fresh fuel over the fire grate. Mr. C. A. Fell, Sheffield, England, a specialist in the subject of fuel economy, developed this particular type appliance, and it is of interest to know that George A. Marshall, 70 Lombard Street, Toronto, is distributing agent for it in Canada.

By means of the fan-shaped projection on the firing surface of the shovel, the fuel is spread so finely over the fire that the gas is driven off suddenly and ignites very quickly. In this way the furnace temperature is kept up to a maximum and so far from an extra supply of air being necessary, the draught may be lessened by partly closing a damper. The shovel is designed to get a similar effect as with a mechanical stoker of the sprinkling type, and thus the amount of steam generated in the boiler is increased by the sprinkling action without the necessity of going to the high first cost of the mechanical stoker. This is particularly advantageous in districts where manual labor for stoking is cheap, while the cost of buying, transporting and erecting a mechanical stoker would be correspondingly heavy.

It may be argued that the fire needs firing oftener, and, therefore, the fire door has to be opened oftener, but the door is not kept open for such long intervals at a time owing to a less number of shovelsful being necessary to cover the fire. Further, owing to the thin layer of fire used, it is not necessary to open the fire doors so often for raking, slicing and poking. Again, as less draught is necessary, there is obviously a less quantity of excess air drawn through the flue when the fire

SPRINKLING SHOVEL.



door is opened, and, therefore, the boiler and its setting is not cooled down to such an extent during the firing and raking operations.

This simple modification of the ordinary firing shovel is a distinct step in the direction of boiler economy, and has the additional advantage of training the fireman automatically in the production of a high rate of steaming.

A NEW WIRING PRESS.

A NEW long stroke wiring and forming press as illustrated has recently been developed and put on the market by the Cleveland Machine & Mfg. Co., Cleveland, Ohio. This machine is intended for deep forming of light sheet metal parts, and for wiring the edges of wash tubs, water pails, ash cans and similar articles. The bed area is 32 inches front to back by 32 inches right to left, and the stroke of slide, 20 inches, gives plenty of room for handling the work at high speed. To secure a rigid frame and proper gib arrangement, the uprights or housings are made very deep, front to back, and heavily ribbed. Lugs on the back of the gibs fit in cored pockets in the housings and take the pressure of the adjusting screws. This construction gives an unusually good bearing for the slide and at the same time permits the latter to be removed from the machine without taking down the housings.

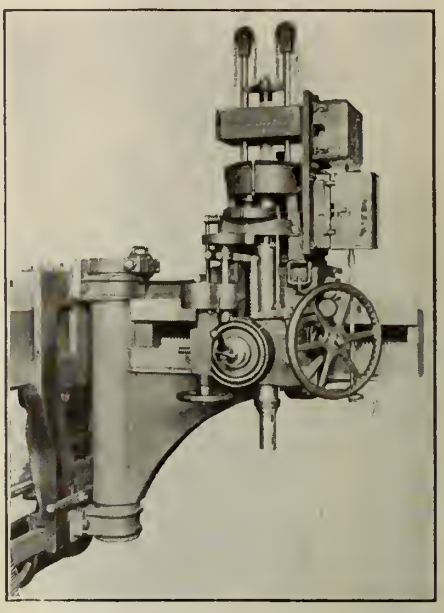
The machine is double geared, with a ratio of 10 to 1. The drive is by belt through a 30-in. x 5-in. fly wheel which acts as a pulley. A cone friction clutch mounted in the fly wheel is operated by a cam on the main shaft under the bed, which automatically releases the clutch on the up stroke and applies a brake to

A NEW WIRING PRESS.

the driving shaft. Pressure on the foot treadle releases the brake, and the clutch is thrown in by a weight, which is cushioned in the dash pot.

For purposes of setting dies, the automatic arrangement of clutch can be disengaged by loosening a nut on the lever shaft, and the machine can then be operated by means of the hand lever. The total weight of the machine is 7,000 lbs.

MULTIPLE RADIAL DRILL.



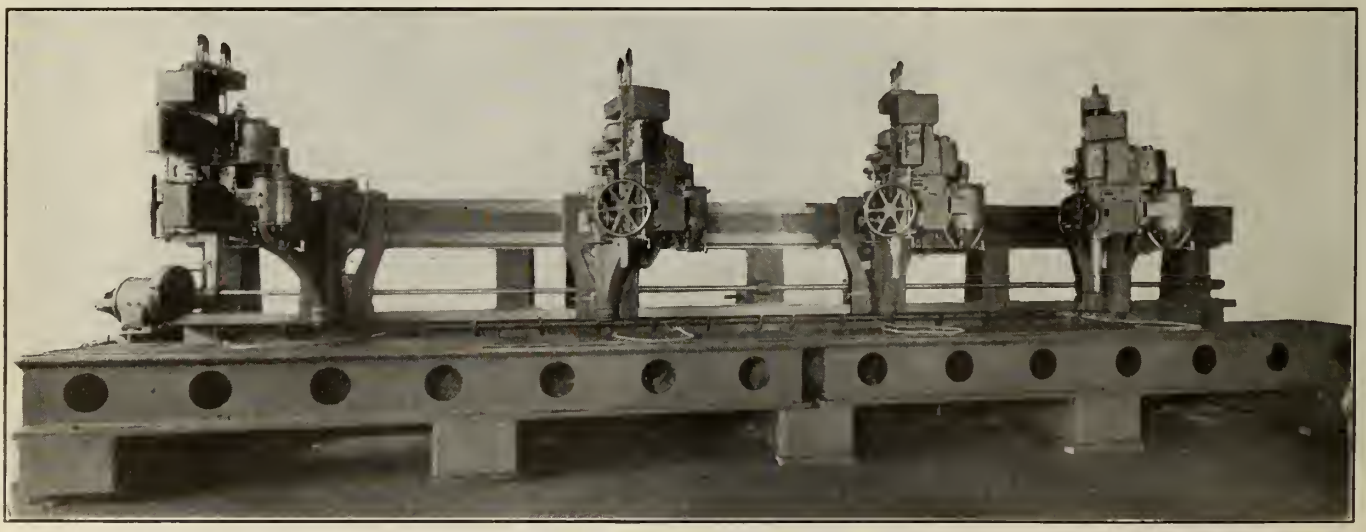
THIS machine has four radial arms mounted on one long cross-rail with lateral traverse by power in addition to radial and in and out movements of the arm and spindle head. Each head carries its own driving motor and all movements of each head are controlled by the operator from his position in front of the spindle.

The spindle heads have adjustable steel rollers running on the wide top track of the arm providing easy movement by the hand wheel and worm in an angle rack. The variable speed motor is mounted on the back of the head behind the arm and the controller handle is brought down behind the traverse wheel. The gearing from the motor has two changes by a positive tooth clutch operated by a lever on the left side of the head. The spindles are forged from high carbon steel, have a large diameter in the sleeve and a squared upper end for the driving gear. Ball bearings are provided for drilling thrust, and under the counter weight yoke.

The feed has three changes by selective pin, and is driven by gears from the spindle through a safety friction. A positive tooth clutch controlling the feed worm can be operated either by hand or automatic trip. A wheel is provided on the worm for hand feed and the rack pinion is connected to the worm gear by a quickly operated saw tooth clutch and hand lever for spindle return.

The arms are of heavy box section and are mounted on the saddles by roller and ball-thrust trunnion bearings. The binder on the top trunnion is operated with air by a hose connection to a valve on the spindle head. The saddles have a long bearing on the top rail to prevent tipping, with support against the lower rail for drilling thrust. The power traverse gearing is carried on each saddle, permitting independent motion in either direction by means of a double clutch between bevel gears. The motor for driving traverse operating shaft is located at the left end of the base, and has sufficient power to move all heads at one time.

The cross-rail is made double, the top part carrying the direct load and side strain, and the bottom taking the drilling thrusts. These rails are secnrely fastened on five heavy box section uprights which are mounted on a deep and heavily ribbed cast iron base running parallel with the cross-rail. Five cast iron sub-bases support both the cross-rail and table and are to be bedded below the floor level.



MULTIPLE RADIAL DRILL DETAIL.

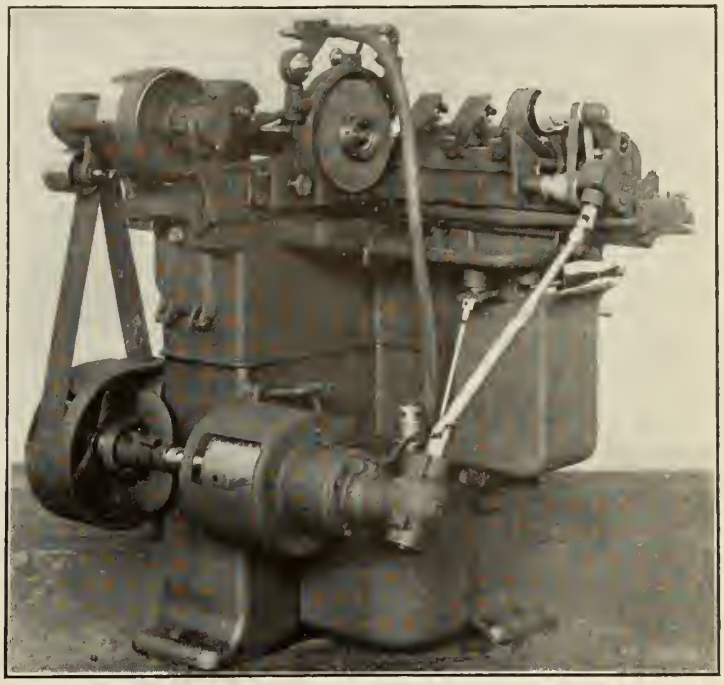
The table is made in two parts joined in the centre to make one continuous surface.

The drilling capacity in steel at 65 feet per minute is 1½ inches; the spindle speeds are 75 to 300 r.p.m.; the feeds per revolution are .005, .009 and .015 inches; the size and speed of motor on heads, 7½ h.p. and 825 to 1,650 r.p.m. respectively; the size and speed of traverse motor, 7½ h.p., 750 r.p.m.; extreme space 43 ft. 4 in. by 9 ft. 9 ins.; height over all, 10 ft. 5½ in.; and weight, including motors, 85,500 lbs.

Edwin Harrington, Son & Co., incorp., Philadelphia, Pa., are the builders of this machine which is known as their No. 32. Multiple Radial Drill.

HARRINGTON MULTIPLE RADIAL DRILL.

NORTON 3-IN. x 18-IN. PLAIN GRINDING MACHINE.



THE Norton Grinding Co., Worcester, Mass., are putting on the market a small machine for grinding cylindrical work, which machine will be known as the 3 in. x 18 in. Horton Plain Grinding Machine. It is made to swing 3 in. in diameter in order to give room for suitable steadyrests for supporting work from ⅛-in. diameter to 1-in. diameter, and up to 18 in. in length, but is best suited for work from ⅛-in. to ½-in. diameter. It is designed for finishing cuts only, where there is not more than .004 in. to .008 in. stock to be removed from the diameter of the work. This machine is especially useful on the grinding of such work as small twist drills, tool work, typewriter, sewing machine, phonograph, cream separator, roller bearing, and electrical apparatus parts.

The design is novel in that the machine is self-contained, no overhead works being required. It can be driven by belt either from above or below, or by a motor placed on the floor at the back of the machine. The table reverse is pneumatically cushioned, making it possible to operate the table at a maximum speed of 27 feet per minute. There are 8 table speeds provided, the slowest being 17 inches per minute. The automatic and hand cross feed, while of entirely new design, sacrifice nothing in the matter of accuracy in sizing the work. The control of the work revolution and table traverse is unique in that while either can be started separately or simultaneously, the stopping of the work always stops the table, and the table cannot be

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World.

CANADA'S TRADE INCREASED.

THE Customs revenue of the Dominion for the past calendar year has totalled $113,885,024, an increase of $4,453,918 as compared with 1912. The increase, however, is due to a good start in the early months of the year, before the financial depression had well set in, and before merchants and wholesalers had begun to restrict their importations of goods for the fall and winter trade.

During the past three or four months there has been a marked decrease in Customs revenue as compared with the corresponding months of last year. In November the decrease was $1,572,490. For the month just ended it has been $991,175. The total Customs revenue for December was $7,779,080, as compared with $8,770.255 for December. 1912.

A Net Decrease.

The fiscal year thus far now shows a net decrease of $1,017,253. Total Customs revenue for the nine months since April 1 last has been $84,278,786, as compared with $85,296,039 for the corresponding nine months of 1912. The increase in Customs revenue during 1912, as compared with 1911, was approximately $26,000,000. This year the increase has only been about one-sixth of that amount.

Trade Figures.

Trade figures for the full calendar year are not yet available, but for the twelve months ending with November last, the total was $1,132,670,000, as compared with $1,005,700,356 for the preceding twelve months. The total trade in merchandise, included in the former figure, was $1,108,413,015, made up of $665,196,828 imports and $419,073,050 exports of Canadian produce, and $24,143,137 exports of foreign produce. Imports of coin and bullion totalled $7,215,980, and exports $17,041,005.

As compared with the twelve months ending with November, 1912, there was an increase of $37,325,297 in imports of merchandise, and of $84,861,383 in exports of Canadian produce.

GEORGIAN BAY CANAL COMMISSION.

W. SANFORD EVANS, former Mayor of Winnipeg, it is learned, will head the Commission which the Government proposes to appoint to consider the economic feasibility of the Georgian Bay Canal proposition. The Commission, it is expected, will be officially named in a few days, and will consist of three members—one from the West, one from Montreal, and the other from Ontario. Huntley Drummond, of Montreal, has been favored by many as the Quebec representative, but a French-speaking man may be selected. Unofficially, ex-Mayor Laporte is spoken of. Save as regards the chairmanship, however, no decision has been arrived at.

It will be recalled that some years ago a complete survey for the projected work was made and the cost was estimated at $100,000,000. There has since been a revision of the estimate and the figure now is placed around $125,000,000.

The reports made so far established beyond question the practicability of the canal as an engineering work. What the Government now wishes is a report as to the economic side of the undertaking. Very naturally before embarking upon a transportation scheme of such magnitude it desires to know whether it would be a paying proposition and fulfil the object for which it has been sedulously propagated for half a century. The Commission to be appointed will have full inquisitorial powers.

Mr. Evans is a Winnipeg financial broker. He was born at Spencerville, Ont., in 1869, the son of Rev. Dr. J. S. Evans; was educated in Hamilton and at Victoria University, and in 1897 began a newspaper career. He was editor of the Winnipeg Telegram 1901-5, and Mayor of Winnipeg 1909-11. He was president of the first Canadian Club (Hamilton, Ont.) formed in Canada. He married Miss Irene Gurney, of Toronto, in 1900.

CANADA'S COAL OUTPUT IN 1912.

THE production of coal in Canada in 1912 exceeded that of any previous year, the total production being reported as 14,512,829 short tons valued at $36,019,044, and constituting nearly 27 per cent. of the total value of the mineral production of the Dominion during the year. Compared with 1911, in which year the production was 11,323 388 short tons valued at $26,467,646, an increase is shown of 3,189,441 tons, or 28 per cent. in quantity and $9,551,398, or 36 per cent. in total value.

The largest previous year's output was in 1910, when the production was 12,909.152 short tons, valued at $30,909,779, compared with which 1912 shows an increase of 1,603,677 tons or 12 per cent., and $5,109,265, or over 11.6 per cent. in total value.

In Nova Scotia there was an increased production in 1912 of 779,468 tons, or 11 per cent., over 1911. This province produced nearly 54 per cent. of the total in 1912, as against 62 per cent. in 1911. The production in New Brunswick is quite small in proportion to the other provinces, and amounted to only 44,780 tons in 1912, a decrease of nearly 20 per cent. from 1911. In the West for the first time on record, Alberta has the largest production, amounting to 3,240,577 tons, the production in British Columbia being 3,208,997 tons. The latter province would have had a higher production had labor troubles not prevented a normal output. The production in Alberta is the highest record for that province, while in British Columbia the greatest production was attained in 1910.

WESTERN DEVELOPMENT.

MEDICINE HAT'S building statistics show a forty per cent. increase during 1913, the figures being $3,851,572, as compared with $2,836,219 for 1912. Customs receipts increased 70 per cent. The figures are: 1913, $316,872; 1912, $184,759. Ten factories were erected at a total expenditure of $3,000,000, and homestead entries totalled 134 for December.

Statistics for the past year for Saskatoon show bank clearings, $96,034,723.27; Customs receipts, $1,087,510.70; building permits, $2,633,845.

Regina reports bank clearings for December, $13,356,411, and for the past year, $132,087,457, being an increase in clearings for the year of $16,357,806. Building permits for the year were $4,018,350; slightly less than the previous year. Over seven hundred new houses were erected.

Bank clearings of Calgary for the past year were $247,882,928, against $275,492,303 in 1912, which was Calgary's big year of development. Building permits were about $8,000,000.

REGULATIONS REGARDING SCALES.

THE weights and measures regulations of the Department of Inland Revenue have been amended to provide that no spring scale of the dead load

type or of the combined lever and spring-scale type, except such as are constructed on the correct knife-edge principle and approved by the Department shall be manufactured in or imported into Canada. Such scales must not be sold, offered for sale or kept in stock after sixty days from the date of the new order. Scales of the type described where now in use may continue to be used subject to departmental inspection.

Exceptions to the above prohibitions are made in regard to ice spring scales, sportsman's pocket spring balances up to 15 pounds, photographers' mixing scales up to 16 ounces, and the farmers' milk scale. Family or household scales hereafter must comply with the requirements of trade scales of their class. Manufacturers' and dealers' stocks of such scales may be inspected and stamped for a period of sixty days from the date of the new order.

Except in regard also to existing stocks, the new regulations provide that the weight graduations on beams and dials of all weighing machines shall be equal amongst themselves unless otherwise specially provided. New schedules of tolerations of error for various classes of scales and new regulations governing measures of capacity are published in technical detail.

Railway companies are required to provide a test car for the inspection of all track scales within six months. The Order-in-Council under which these changes are made provides also for a reduction in the fees charged for the inspection of scales inspected oftener than biennially. The present rate is two-thirds of the ordinary fee.

BUSINESS PARTNERSHIP INSURANCE.

By Sheridan Campbell.

THE public is waking up to the supreme importance of partnership or business insurance. The value of the individual life to a partnership or to a corporation is being more fully recognized, and, as a consequence, it is becoming a general practice among partners in every line of business to insure their lives for the benefit of the firm.

This insuring of partner's lives for the benefit of the business is only one of many ways in which a house may use life assurance to protect its interests. Many corporations, as well as partnerships, depend to a large degree upon the skill and ability of some employee whose knowledge, technical or practical, is of prime importance. Almost invariably, the affairs of a large corporation are directed chiefly, if not wholly, by a single individual, or at least by a limited number of individuals. The death of a manager may mean heavy financial loss, which ought to be covered by insurance, and the death of one member of a firm, in addition to the loss of his active co-operation in the management, may involve the withdrawal of his capital from the undertaking. This latter might mean infinite embarrassment to the remaining partner or partners, and perhaps the discontinuance of the business. If, however, his life is insured for the benefit of the firm, the proceeds of the policy would enable the remaining members to buy his interest and continue the business without hindrance or delay. Protection of the interests thus involved is accomplished usually by a separate policy on the lives of those upon whom the successful conduct of the business may depend, although this is sometimes met by a joint life policy covering all the lives it is desired to protect.

The death of a co-partner naturally awakens uneasiness among creditors, which may result in embarrassment to the firm. When it is known, however, that the deceased member's life was insured for the benefit of the firm, confidence instantly takes the place of doubt and hesitation.

Banks and wholesale houses well understand the difficulties that beset a business firm upon the death of a member, and this is a risk which is always considered in granting accommodation. No one feels the pulse of the business world on matters of credit better than the great commercial agencies. The late Charles F. Clark, President of the Bradstreet Company, a short time before his death, wrote a friend as follows:

"It is practically beyond a doubt that corporation insurance strengthens the credit of firms adopting it. The increased confidence which it establishes is recognized in the mercantile community, and thus reflected through our reports."

A Real Necessity.

No partnership or corporation would for a moment fail to insure its property or plant against fire, yet the death of a co-partner, or of a managing official may cause even more serious embarrassment than a destructive fire and, as a matter of fact, is more likely to occur. Every member of a firm, every manager of a corporation, is bound to die sooner or later, but a fire may never occur. Business insurance requires an expenditure of partnership or corporation funds, the same as fire insurance, but there is the difference that the business insurance policy is a growing asset and will be carried as such on the books of the company; the value increasing from year to year.

In these days when so many large corporations are borrowing from the public by issuing debentures or are asking the public to purchase preference stock, the protection of the interests and earning power of the corporation is a necessity that life insurance supplies. The preparation, for the retiring of a bond issue by a company at maturity, by the carrying of endowment insurance is another feature of the present day insurance propaganda.

Provision is made in the policies whereby, at the dissolution of a partnership, the retiring partner may continue his own policy on his own account if desirable, or a cash settlement may be had. The present day policies are so well designed, that almost every conceivable point has been safeguarded to the advantage of the insured.

Employees Accident Insurance.

Manufacturers, contractors, builders, lumber manufacturers, millers, etc., all find it to their advantage to carry protection against claims arising out of accidents to employees and others by the issuance of accident insurance. Commercial travellers, business men, doctors and men in all walks of life also avail themselves of the benefits of accident and health insurance, and what business house, bank or financial corporation does not place on some responsible employee a guarantee bond to indemnify themselves against loss through misuse of funds.

Farmers are in these days insuring their standing crops against weather; also their valuable animals, which all goes to show to what extent the principle of insurance is being adopted, and the variety of business interests affected.

If it be wisdom to protect one's property against "possibilities," how much wisdom is displayed when protecting against "certainty." There can be no doubt as to the wisdom of protecting one's family against the cutting off of the earning power of the home. The interests of the business world and the home are identical; the loss sustained by a business through the death of a partner, being immediately reflected back to the latter's family.

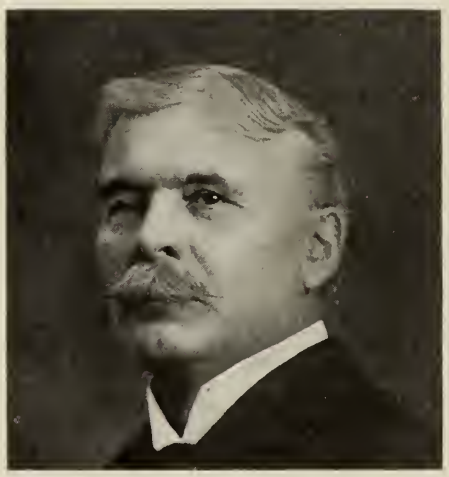
Business insurance secures the speedy adjustment of a deceased partner's interest, and admits of neither inconvenience to or cessation of operation.

NORTON GRINDING MACHINE.

(Continued from page 45.)

started unless the work is revolving. The act of stopping the table connects the hand wheel for moving the table by hand, and this hand wheel is disconnected when the table is started. The table is of new design in that the footstock covers the dovetail ways on which the footstock slides, protecting these ways from dirt and injury.

The steadyrests, designed especially for small work, are provided with micrometer stops, and are arranged for quick handling. The workshoes are of steel, hardened and ground.



INDUSTRIAL NOTABILITIES--No. 16

THE plant of the Dominion Steel Corporation is in Sydney, N.S. The President, James Henry Plummer, resides and works in Toronto. Once in a while he puts on his hat and coat and runs over to Sydney for a look over the plant. Like a war in Afghanistan being directed from the War Office in London, the brain which controls the Steel Corporation's operations is away from the scene of actual production.

One remarkable thing about J. H. Plummer is his wonderful memory. If he is not at Sydney, Sydney is with him. He keeps the details in his head. If a certain task is to be performed in a year's time he will expect it done. In this regard he differs from the presidents of many other large corporations who concern themselves only with the big affairs. J. M. Plummer carries the details of the Sydney plant around with him.

He is an indefatigable worker, not only in his office, but at Sylvan Tower, Rosedale, his beautiful Toronto residence. Men who have been invited to his mansion tell of late hours spent in solving problems connected with this gigantic industry. Under the greatest provocation he never loses his temper. His coolness is characteristic.

J. H. Plummer was born near Tavistock, Devonshire, England, February 19, 1848. His father was the late William Plummer, Commissioner of Indian Lands in Canada. He received his education at Upper Canada College, and in 1866 he took his first earning position in the service of the Bank of Montreal. On the organization of the Canadian Bank of Commerce he joined their staff, becoming the manager at Barrie, Ont., in 1870.

JAMES HENRY PLUMMER.

In 1872 he was manager at Brantford. He held the same position at Ottawa in 1874, and became inspector of the bank in 1876. Mr. Plummer lived in Michigan from 1878 until 1882, and on his return to Canada, entered the service of the Merchants' Bank, taking the office of Assistant General Manager, and remaining with that bank until 1900, when he became associated with the Bank of Commerce. In 1903, he became President of the Dominion Iron and Steel Co., Ltd. Since 1910 he has been President of the Dominion Steel Corporation, Ltd.

He is President of the Dominion Coal and Steel Companies, Sydney and Louisburg Railway Co., and Cumberland Railway and Coal Co.; a director of the National Trust Co., of the Sao-Paulo Tramway Light & Power Co., and of the Bank of Nova Scotia; Vice-President of the Canada Life Assurance Co., and President of the Canada Lake Transportation Co.

Mr. Plummer was commodore of the Royal Canadian Yacht Club 1900-1901, and is a member of most of the leading clubs in Toronto and Montreal. He was married in 1871 to Annie McConkey, of Barrie, Ont., only daughter of the late Thomas D. McConkey for many years a member of the House of Commons. Most of his time is spent in Toronto, but in summer, he takes his two sons and three daughters to Sydney, where he has a home on King's Road. When not very busy he plays golf, but he is usually very busy.

CANADIAN NATIONAL EXHIBITION MACHINERY HALL.

THE recording of a vote adverse to necessary additions and extensions projected in the present year at the Canadian National Exhibition, Toronto, is a regrettable happening, and again exemplifies the fate which befalls every effort made in the direction of real tangible and "worth while" domestic, social, scientific, civic and political progress, when some other and less important issue, but one in which personal spleen is rampant and spreads itself, makes men lose their heads. The pity of it all is that the big show held annually at Toronto in the early fall, and known over the North American Continent and abroad as the Canadian National Exhibition, should be at the mercy and whim of the constituents of any particular municipality.

Much attention was paid and substantial effort directed during the Exhibition of last year to have the total attendance pass the million mark, as if mere turnstile records constituted a successful result, and while we have no idea of deprecating the many departments of usefulness which contribute towards a united expression of the Dominion's development and progress, we do think that the section known as the Machinery Hall does not receive the high degree prominence which is its right, because of the place and part occupied and played by our arts, crafts and manufactures.

A large proportion of Canada's population are directly engaged in some more or less kin manufacturing industry to mechanical, electrical, steam and hydraulic engineering, and it goes-without-saying that a high percentage of the offspring of those now actively engaged in mechanical pursuits will follow this same trend. Machinery, perhaps, more than anything else, holds a fascination for the schoolboy growing into manhood, a circumstance amply borne out, we think, by the large and increasing numbers enrolling in the several engineering courses at our colleges and universities.

Engineering in its widest scope has contributed more to the development and commercial achievement of Canada than has any other feature, not excepting agriculture, for it has made the latter capable of attaining a prominence and value not otherwise possible. Exhibitions, such as we have in Toronto each year, are of high educative value in a variety of manner, and may be so even in their most frivolous features, but it must be remembered that out of say half a million adult or juvenile males who enter the gates in one short season, a large proportion are mechanics, or are engaged in mechanical pursuits, and to these the fuller education derivable will be that obtained from the study of a display of machinery in whose completed perfection they may be daily employed in the preparation of one or more detail parts.

We live in a day of specialization, as a consequence of which it is not given us to see or know much of what others are doing outside our own particular sphere. An exhibition diversified in its contents and representative in the scope of and provision for the sectional features which are indicative of the bent of our population, gives all, and it may be the only opportunity to acquire that general knowledge which for its own sake is valuable, but which furthermore is immeasurably helpful to our individual specialization.

At the recent elections in Toronto, an indifferent acquiescence was observable in that it would be advisable to support the by-law to provide funds for adding to and extending the scope and usefulness of our National Show, but, amid all the electioneering, in its multitudinous forms, not one of the prospective candidates and a similar quota of electors in the various wards had the gumption and backbone to step out from the arena of bandying personalities and impress the necessity of getting away from local petty jealousies, to allow of something being accomplished in a national sense.

The complacent view taken of the defeat of the by-law, that on account of the money stringency, it is just as well that the decision was adverse, is too silly to discuss, for if anywhere in Canada, or for that matter anywhere else in municipal civilization, money is spent in a happy-go-lucky fashion, it is in hair-brained schemes promoted and fostered by the Corporation of Toronto.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Jan. 5, 1914.—The beginning of the new year sees most lines of business rather quiet, and it is unlikely that there will be any material improvement during the present month. Machinery brokers have had no opportunity for submitting any important tender since the middle of last month when quotations were put in for the G. T. P. equipment at Prince Rupert, B.C.

A number of factories reopened their doors to-day, after being closed down since December 31 for the New Year holidays, which are always carefully observed in this province. Some plants would doubtless have re-opened on Jan. 2 but for the scarcity of water following the recent breakdown of the intake conduit, reported last week. Repairs were effected by the early morning of Wednesday, December 31, but proved to be of such a flimsy character that they gave out after the pumps had been in operation only ten or fifteen minutes. The engineers on the job at once set to work to again effect repairs; but it was not until late in the evening of January 2 that the long-suffering public were once more able to obtain a normal supply from their taps.

Good progress is being made with the plant of the Canadian Vickers Co., Ltd., at Maisonneuve. A handsome office building is rapidly approaching completion, and the power house and the joiners' shop are nearly finished. The platers' shed will be the next building to be erected, and by the time navigation opens, the site will present a very different appearance from what it does now. It is understood that the mechanical equipment is being purchased in Great Britain.

Metals.

Copper shows a slightly firmer tendency, but the metal market generally is extremely dull. A leading dealer in old metals stated to-day that he had not sold a car of material for a month, and saw no immediate prospect of any improvement.

Tool steel salesmen also complain that they are unable to obtain anything but a few small orders.

Errors in Weighing Apparatus.

The issue of The Canada Gazette, dated January 3, 1914, contains eleven pages of amendments to the present weights and measures regulations, which are of great importance to makers and users of scales. One of the most important amendments is that which provides that after sixty days from date, no spring scale of the dead load type shall be manufactured in or imported into Canada, but that all such scales now in use may continue to be used, and be periodically inspected and stamped as required by law until found incorrect and incapable of being made correct without the renewal of some fundamental part of the mechanism.

Six exceptions to this regulation thereafter follow, dead load spring scales being permitted for the weighing of ice and certain other commodities.

Toronto, Ont., Jan. 6, 1914.—For some weeks manufacturers in Ontario have been waiting for the time when they could buy steel bars at $1.15 f.o.b., Pittsburg. The tendency on the part of the buyers has been to find the low market, and this very tendency is a symptom that the market will go lower, or that there is about to be a strengthening. While it is a buyers' market, nevertheless, the situation will be controlled by the manufacturer's conviction that he is selling as low as his costs will permit. Many feel that as soon as the buyer is convinced that the manufacturer is willing to rest upon his conviction, then buying will begin. Very few firms really need steel just now, though many would like to make contracts for next March, if they were only sure that the market would go no lower than 1.20. Steel makers are anxious to get business for their mills at once, but are not anxious to burden themselves with orders for June, say, at present prices, when business might be flourishing and prices much better.

Warehouse business remains about the same. Practically all interest centres in the mill end of the business. Inquiries are being made by all classes of manufacturer. It is likely that as soon as one begins the rest will follow.

While little business in steel bars is being done, the Dominion Steel Corporation, who do a big business in Ontario in wire and nails, report that the New Year has opened up remarkably well, and that if every day is as good as the first days of the year, 1914 will be a good year. Just now the retailer is getting ready to take stock, following the Christmas and New Year trade. He is not ready to buy, except special goods. Consequently, the jobber, who is still going over his inventory sheets, is not buying. So business in wire, nails, screws, bolts, and the like is slack.

Drummond McCall & Co. report that the New Year started off well. They believe that stock prices will be firmer now that the old year has gone.

There is practically nothing to say regarding machine tools. Little buying is going on. Specifications for tools required in their new Ottawa shops should be issued by the C. N. R. shortly.

The metal market is unchanged.

St. John, N.B., Jan. 3, 1914.—Tenders are soon to be called for the erection of the proposed plant of T. McAvity & Sons, Ltd., which will cover an area of twenty-two acres. The list of buildings to be erected includes a warehouse, two iron machine shops, two brass machine shops, two casting storage shops, malleable iron foundry, grey iron foundry, pattern shop and storage, core room, brass casting storage, brass foundry, power house, administration building, garage and stable.

About 175 men have been laid off by the J. S. Metcalf Co., who are building the new grain conveyors at West St. John. The lay-off was necessitated by the rapid construction progress. By

February the new conveyors will be completed and in operation.

A. V. Tracy-Gould, of the firm of T. Pringle & Sons, Ltd., of Montreal, has been in St. John with the intention of establishing a branch of that company here in view of the prospects of industrial development. The only branch at present is in Toronto, but another is to be opened in Calgary and one in Vancouver later on.

DOMINION STEEL CORPORATION.

THE year just closed has been in many respects the most satisfactory in the history of the Dominion Steel Corporation. Its collieries and steel works have been operated to their full capacity throughout the whole period, and the results are the best that have yet been obtained. Its army of 16,000 or 17,000 employees were kept constantly at work, and it is claimed that no similar body of men in Canada received as large an average daily wage.

The combined output of collieries in Cape Breton and Cumberland Counties will reach the unprecedented total of 5,100,000 tons, nearly 200,000 tons greater than the output of 1912, which in turn exceeded all previous records.

New Loading Pier.

The most important item in the way of improvement to the Coal Company equipment is the new loading pier at Sydney, a structure some 1,500 feet in length, fitted with the most modern appliances for rapid and satisfactory work. As an evidence of what this means it may be mentioned that a coal carrying freight steamer of 10,000 tons capacity can be fully loaded in about seven hours. In the month of June, shortly after its completion, H.M.S. "Cumberland" was moored at this pier and received 1,200 tons of bunker coal in 12 hours. To facilitate the work of coaling cargo steamers calling at Sydney for bunker supply a new conveyor has been constructed on the "Whitney" or No. 2 pier.

Large expenditures were made in completing the equipment of the newer collieries in the Waterford district, in the erection of workmen's houses and in preparation for the re-opening of the Victoria Mine.

Steel Works Active.

The Steel Works were equally active, and the extensions to the plant which had been in course of construction during the two or three previous years were brought into service. The most notable of these were the big open hearth furnaces, known respectively as A and B. These were put into commission in the first quarter of the year. Blast furnace No. 7 was "blown in" on May 22, and is regarded as the best of the six that now constitute the company's smelting plant.

On Saint Patrick's Day the merchant bar mill became a producer, and at the close of the year had turned out 16,000 tons of steel bars of all sizes, from ¼-inch to 1¼-inch in diameter, as well as flats and other shapes. The major portion of this tonnage was specially made for reinforcing heavy concrete work, such as the foundations and walls of grain elevators, hydraulic works, etc. At Port au Port a new limestone quarry was opened and equipped with machinery for quarrying, crushing and preparing the stone for blast furnace use. A shipping pier was built, and conveyors installed with sufficient capacity to load a 10,000-ton steamship in a few hours. Shipments were made from the new works as well as from Marble Mountain during the season of navigation.

Among the minor improvements to the Sydney works may be mentioned a powerful travelling gantry crane for use of the blast furnace department, a third open hearth charging machine, and a furnace for reheating steel ingots in connection with the blooming mill.

Works Capacity.

In the past two years the Steel Company's works have not only been greatly enlarged, but they have also been made capable of producing a greater variety of materials. Before the completion of the wire and nail mills, completed in 1912, and the merchant bar mill, referred to above, the output of the works was confined to rails, wire rods and such moderate quantities of pig iron and steel blooms as could be spared after the requirements of the rail and rod mills were provided.

It is now possible to market in addition as many rails as ever, a large tonnage of pig iron, wire and wire nails of all kinds—plain and galvanized—fencing, staples, square, round and flat steel bars—straightened or twisted if required—as well as blooms for car axles and billets for use in the smaller rolling mills throughout the country which do not produce their own raw material. The possible output has been not only greatly increased, but it has become more varied and in consequence more flexible. In other words, the company is in a better position to adapt its output to the requirements of the market.

Year's Results.

The following figures will closely approximate the actual results for the year:

Department.	Tons.
Coal mines	5,100,000
Iron ore mines	780,000
Limestone quarried	582,000
Pig iron produced	357,000
Steel ingots produced	347,000
Rails	175,000
Blooms sold	32,000
Wire rods made	32,000
Wire and wire products	24,000
Steel bars, etc.	16,000
Sulphate of ammonia	5,000
Basic and granulated slag	25,000
Tar (gallons)	5,650,000

Outlook Encouraging.

The outlook, though not as certainly assuring for the coming year as it was at the end of 1912, it still quite encouraging. Orders upon the books are sufficient to ensure active work for some months to come, while enquiries indicate that there will be no serious abatement in the country's requirements of the basic products of these great works, and there is always the possibility of disposing of surplus tonnage to the sister Dominions across the seas.

The steamers of the New Zealand Shipping Company have made regular calls at Sydney for some months, and have taken moderate quantities of steel products as well as bunker coal. These calls will be continued during the winter unless ice conditions are unfavorable, in which case the ships will go to Louisburg. Australia, which some years ago took a large quantity of Sydney rails, has lately given an order for a fair-sized lot, and the indications are that when the mills are ready to start up after a rest of ten days for necessary repairs and setting up there will be work enough in sight to keep them running full time.

CANADIAN MARINE WIRELESS RULES.

NEW wireless regulations governing navigation throughout the Dominion came into force on January 1, when all provisions of the Act governing Canadian wireless passed last session by Parliament became effective. Roughly speaking, the result of the new regulations is that no vessel carrying 50 or more passengers or going 200 miles or more may hereafter be without wireless apparatus. Winter navigation on both coasts of Canada will feel the effect of the regulations immediately, but it is understood that most vessels engaged in ocean traffic are already equipped with wireless as required.

The main changes necessitated by the Act will be in lake vessels, but this will not be until the resumption of navigation next spring.

J. J. Carrick, M.P., Port Arthur, has returned from England, but will say nothing about the steel plant which he and the Mackenzie-Mann people contemplate erecting.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Sydney, N.S.—The Sydney Foundry and Machine Works, Ltd., have planned a number of extensions for 1914.

Waterloo, Ont.—Bechtels Limited, makers of clay working machinery, dump carts, etc., advise that they are not being offered inducements to move their plant.

Coaticooke, Que.—The A. O. Norton Co., makers of lifting jacks, are rushing the erection of a new shop on Cutting Street, in which work for all their men employed in the plant burned last week will be found.

Sydney, N.S.—Shaw and Mason, stove and brass founders, are planning large extensions for 1914, and though no definite scheme has been decided upon, it is expected that when the spring opens up, important announcements will be made.

Saskatoon, Sask.—Two iron claims consisting of 50 acres each, were staked recently at Yorkton, Sask., by W. Dell, a prospector of Port Arthur. Surface mining by means of steam shovels is proposed. The claims are six miles north of Kamsack, Sask.

Electrical

Paisley, Ont.—The new council will deal with the extension of the waterworks, and the electric lighting system will be discussed, as the power is not equal to the number of lights being used

Winnipeg, Man.—The Kildonan council have applied to the city of Winnipeg for the lighting of Main St., from the limits of the city to the municipality.

Shoal Lake, Man.—The ratepayers have passed a by-law authorizing an expenditure of $15,000 for the installation of an electric light plant.

Cobalt, Ont.—The Don Huronia Mine, near Larder Lake will be closed in order to develop a water power which will enable them to operate the mine and the mill on a large scale.

Toronto, Ont.—Among the municipalities which voted for Hydro-Electric power this week were, Wallaceburg, Hanover, Fergus, Elora, Strathroy, Tilbury and Chatham.

Sydney, N.S.—The Broughton Coal & Iron Co., Broughton, N.S., are considering an electric plant capable of taking care of 2,000 tons of coal per day, the central power plant to be located at Broughton.

Hamilton, Ont.—The Dominion Power & Transmission Co. have prepared plans for their steam auxiliary plant, which will occupy 14 acres east of the National Steel Car. Co. plant. The main building will be 380 x 170 ft. by 50 ft. high. The transformer house will be 75x250 ft. Two units will be installed this fall, of 13,400 h.p. capacity. A unit will be added each year until the capacity is 88,000 h.p. W. C. Hawkins, managing director.

Municipal

Galt, Ont.—The city will spend $15,000 on its waterworks.

Woodstock, Ont. — Embro village wants Hydro-Electric power.

Guelph, Ont.—The city will spend $17,000 on two new street cars and a new feed wire.

Brantford, Ont.—Preparations are being made to connect the gas pipes with the old purification plant.

Hamilton, Ont.—A by-law providing $335,000 for extensions to the Hydro-Electric system was passed on Jan. 1.

Nelson, B.C.—The ratepayers have voted in favor of purchasing the street railway. The city recently took over the gas works.

Toronto, Ont.—The ratepayers on January 1 voted in favor of the city acquiring a portion of Toronto and York Railway.

London, Ont.—The by-law to loan $25,000 to the Grobb Mfg. Co., who will take over the London Foundry, did not pass at the municipal election on Jan. 1.

St. Vital, Man.—Third readings have been given two by-laws to provide $200,000 for water and sewer extensions, and to provide $35,000 for the new fire hall.

Athabasca Landing, Alta.—On Jan. 12 the ratepayers will vote on a by-law providing $85,000 for completing and extending the present waterworks system.

London, Ont.—The Greene-Swift Co. have been given a franchise to lay steam pipes across Carling Street to heat the north half of Dundas Street, from Talbot to Richmond.

Davidson, Sask.—The ratepayers have voted in favor of spending $8,500 on an electric light plant, which is to be purchased from the Canada Gas Produce Co., Barrie, Ont.

Chatham, Ont.—The city is contemplating giving $410,000 for the Chatham Gas Co.'s gas and electric plants. It will be necessary to spend $50,000 to make the electric plant serviceable for the distribution of Niagara power.

Berlin, Ont.—Four rural districts of North Waterloo are preparing to take Hydro power. Their names and rates for 50 h.p. are as follows:—St. Jacob's, $29.08; Conestogo, $36.59; St. Clement's, $42.68; Floradale, 40 horse-power, $51.57.

General Industrial

Port Lambton, Ont.—Part of the machinery for the American Drainage Co. Canadian factory has arrived. The home plant is at Dubuque, Iowa.

St. John's Nfld.—The Royal Biscuit Co., Ltd., has been organized, and will erect a factory here. George Neal, president, Robert Freeman, secretary.

Quebec, Que.—Touriguy & Marois, shoe manufacturers, whose plant was destroyed by fire recently, have secured a new site, and have been granted an exemption of taxes for five years.

Iona, N.B.—The construction of a $50,000 calcining plant for the Iona Gypsum Co. is to be commenced at once, about 1½ miles from Iona Station on the shores of the Bras d'Or Lakes.

Elmwood, Man.—Fire did damage amounting to $25,000 to machinery, stock, etc., and $6,000 to the building of the Winnipeg Tanning Co., Ltd., Elmwood, last week. The loss is covered.

Bow Island, Alta.—W. Overpack, Medicine Hat, has organized the Bow Island Sewer Pipe and Tile Co., who will build a plant here on a 60-acre site. The plant must be operating by Jan. 1, 1915.

Calgary, Alta.—The Royal Linen Mills, Mystic, Conn., will erect a plant here to employ 100 persons, to manufacture all kinds of linen fabric, linoleum, etc. There will also be a flax mill and a linseed oil mill.

Wood Working

Burford, Ont.—A Brantford man is arranging to build a planing mill here.

Strathroy, Ont.—The Handles factory, employing 50 men, was burned on Jan. 5 with loss of $30,000; insured. J. W. Cameron is president of the company operating the mill.

Strathroy, Ont.—The factory of the Canadian Handle Merger was destroyed by fire at a loss of $100,000 on January 5. The new plant will probably be built elsewhere. W. H. Braddon, London, Ont., general manager.

Chicoutimi, Que. — The Chicoutimi Broom factory, in the village of Riviere du Moulin, near here, was completely destroyed by fire last week. The loss will amount to several thousands of dollars. Messrs. Grenon were the proprietors.

Contracts Awarded

Sherbrooke, Que.—MacKinnon, Holmes Co., Ltd., have secured the contract to build a steel bridge at Nicolet Falls, Que.

Winnipeg, Man.—The Board of Control will instal a duplex steam booster pump at the new King George hospital, and have awarded the contract to Cotter Bros. for $550.

Victoria, B.C.—The C.P.R. have awarded the contract for lengthening the coastal steamer Princess Mary, to the British Columbia Marine Railway Co., Esquimault, B.C., work to commence early in January. An oil fuel system will also be installed.

Winnipeg, Man.—A contract has been awarded by the city to the Dominion Equipment Supply Co., representing the Dean Steam Pump Co., of Holyoke, Mass., for the supply of two new deep well pumps, with a guaranteed caapcity of 600,000 gallons per day, costing $7,200 each, and guaranteed to be in operation by April 1.

New Incorporations

Kalmus, Comstock and Westcott, Inc., incorporated at Toronto, capital $40,000, to engage in and carry on scientific research, to invent, and produce machines, etc. Herbert T. Kalmus, Kingston, Ont., the company's attorney.

Pilkington Bros., Ltd., incorporated at Toronto, to carry on business as manufacturers of and merchants dealing in plate, sheet and all other kinds of articles of glass.

Two Miles Falls Water Power Co. has been incorporated at Quebec to develop water falls and to transmit power. Headquarters at Sherbrooke, Que. Incorporators: Israel Louis Lafleur, merchant, Montreal; J. E. Roberge, Lambton, Que., etc.

The Pas, Man.—Tenders addressed to H. H. Elliott, M.D., Secretary-Treasurer of the town of The Pas, will be received up to February 3rd, for the construction of the following work:—Construction of approximately 430 feet of 16 inch supply intake main and two sewer outlets into the Saskatchewan river. Murphy & Underwood, Consulting Engineers, Saskatoon, Sask.

Northern Canada Supply Co., Ltd., incorporated at Toronto, capital $200,000, to engage in the business of jobbers, wholesalers, manufacturers and dealers in heavy and shelf hardware, railroad, street railway, steamboat manufacturers, mill, factory, foundry, forge, shop, machine shop, electrical, builders', plumbers', miners', steamfitters', gas-fitters', and other supplies; tools, cutlery, saddlery and saddlers' goods, round and bar iron, bar and tool steel; vehicles, coal, machines and machinery, powder; to operate foundries, machine shops, repair shops, for the construction and repair of articles mentioned above, at Cobalt, Ont. Incorporators: Charles J. F. Collier, Arthur B. Mortimer, etc., Toronto.

Marine

Sarnia, Ont.—Dominion Government surveyors are at work on the proposed harbor for this town.

Dump Scows Launched.—M. Beatty & Sons, Welland, Ont., recently launched two steel dump scows, 156 ft. x 36 ft. x 14 ft., each of 800 cubic yards capacity.

Vancouver, B.C.—A. F. Yarrow, head of the Clyde shipbuilding firm bearing his name, announces that he has bought out the British Columbia Marine Railway Co., and intends to establish a branch of his yards at Esquimalt, B.C.

Levis, Que.—The shipbuilding firm of George T. Davie & Sons has been acquired by George D. Davie, who will form a new Company, to be known as the Davie Company, Ltd. The Davie firm for years have been closely identified with shipbuilding and salvage interests, and operated the Levis graving dock. George D. Davie will, in all probability, be the President of the new concern, which will be capitalized at $1,000,000.

Ship Assessment.—Rules prescribing the method of measurement for the basis of assessing tolls on ships in the Panama Canada were issued on November 21 in a proclamation signed by President Wilson. They strictly define the cargo capacity of various types of shipping, and in general are framed on the same lines as the rules of the Suez Canal. In some respects they are more stringent than the Suez rules, but in others are more liberal. The rules do not affect the $1.25 per ton rate previously prescribed in a Presidential proclamation.

Dipper Dredge Order.—M. Beatty & Sons, Welland, Ont., have just closed contract for a steel dipper dredge with hull 100 ft. long, 40 ft. beam, and 10 ft. deep; delivery to be made by May 1, 1914. The dredge is of the crane type, with dipper handle and spuds of sufficient length to make 40 ft. of water. The dipper itself is of five yards capacity. This dredge is to the order of the C. S. Boone Dredging and Construction Co. of Toronto, and they will use it on one of the several large harbor improvement works recently secured. This five-yard dredge is similar to the dredges previously furnished by Beatty & Sons for the Canadian Dredging Co., Midland, Ont.; W. E. Phin, Hamilton, Ont.; the Dominion Dredging Co., Quebec, and others.

Tenders

Hamilton, Ont.—The city has received estimates on the erection of a new incline railway at Sherman Ave:—Excavation, $7.200; concrete, $27,000; 50 feet steel span with concrete deck, $25,000: buildings required, offices, etc., $35,000; buildings at top for motors, engines, etc., $55,000; changing sewer, $1,800; paving approaches, $2,800; water connections, $300; concrete piers, pedestal for steel incline, $4,600: steel incline in place, $32,600; two cars 50 feet long, elevating machinery, motors, engines, cables, safety cables, rails, gates, drums, etc., complete, $130,000; wiring for light and telephone, $500; contingencies, $6.400; total, $247,200.

Railways—Bridges

St. Catharines, Ont.—Announcement is made that a by-law will shortly be submitted to St. Catharines ratepayers providing for a bonus of $100,000 to the Canadian Northern Railway Co. in extending its line through this city.

Take Time to Read Your Paper

¶ Occasionally we meet a man who says "Oh, I haven't time to read trade papers! I'm too busy."

¶ He is typical of his class, and his class is growing smaller every year. He belongs to the betwixt and between variety, neither very large nor very small. His business is large enough to keep him at detail yet not big enough to permit of his hiring help to relieve him of petty duties.

¶ We refer to the owner or manager of a business which is just at the stage when it needs all the help and brains that can be given it. If the ideas that are constantly being supplied in "Canadian Machinery" were applied to the small but growing machine shop and manufacturing business, as well as to the large and well-organized industry, results would be amazing.

¶ Reading a trade paper, if a good one, should be one of a business man's first duties. Let him discharge that and the other claims upon his time will grow fewer in number and greater in importance.

¶ One of the most successful of the young men we know looks through "Canadian Machinery" from cover to cover every week. He glances through the editorial section, selects any article that may be applicable to his business, reads the Industrial and Construction News, Markets and special features. Then he starts at the front and reads the advertisements.

¶ His business is well organized, and everything moves like clockwork. He always has time to listen to a good proposition and he is a consistent and liberal advertiser himself.

¶ Take a half-hitch in your time for a few weeks and read your paper thoroughly if you haven't been doing so. It will only take you a few minutes each day, and results will be surprising.

¶ Fall into line with the big body of successful men who are keeping in close touch with changing conditions, improved methods, and new machinery.

Cornwall, Ont.—The promoters of the projected Glengarry and Stormount Railway, from St. Polycarpe Junction to Cornwall, are expecting to have their subsidy voted during the approaching session at Ottawa, and will consequently begin construction as soon as the frost is out of the ground the coming spring. The line runs through St. Telesphore Bridge End, Glen Donald, Glen Roy and Williamstown to Cornwall.

Smithers, B.C.—The proposed bridge across the Bulkley River at Smithers has been authorized by the Department of Works. Construction will start immediately. The approved plan calls for a four-span, Howe truss bridge, with a length of 500 feet. The new structure will be ready for traffic early in the spring. It will be of great benefit to many ranchers across the Bulkley, where there is a large number of farms under development. The bridge will afford direct access to the railway by the shortest possible route, and will mean much to the progressive agriculturists across the river.

Refrigeration

Vancouver, B.C. — The .Vancouver-Prince Rupert Meat Co., 125 Hastings St. W., will erect a cold storage warehouse.

Trade Gossip

The C. P. R. Angus Shops at Montreal were closed down for over a week owing to the inability of the city to provide water.

The Donnaconna Paper Co., Quebec, will be closed down for five weeks to allow its main conduit being repaired. This will cost $15,000.

The Canada Foundry Co. last week paid off all its employees at the Davenport works. The reason given was the reorganization of the entire plant.

The Canadian Borden Co., Toronto, manufacturers of "Beaver" and "Premier" die stocks are distributing a useful souvenir knife among their customers.

The New Machinery Hall at the Canadian National Exhibition, Toronto, for which plans had been prepared, will not be built meantime, the ratepayers having voted against the expenditure.

Green & Sloan, Breadalbane Street, Toronto, have recently started up a welding and cutting establishment. Mr. Green was formerly foreman of the welding department of the Siche Gas Co., Toronto.

Eastern Car Company.—For the week ending December 20, all former records were broken at the plant of the Eastern Car Co., when they turned out 175 cars within the week. Up to date something like 840 cars have been turned out.

A. O. Norton, Ltd., makers of lifting jacks, whose plant at Coaticook, Que., was partly destroyed by fire last week, had only just completed details in connection with the organization of the new company. The capital stock is $250,000.

Shaw and Mason, stove and brass founders, Sydney, N.S., marked their 1913 progress with the erection of a three-storey 100x30 warehouse, and the reorganization of their works generally. During the year they took over the good will and plant of the Scotia Stove Foundry, of Halifax, and have incorporated the patterns of this Company's best lines in their manufacturing list. The foundry was considerably extended.

The John Bertram & Sons Co., Ltd., Dundas, Ont., have introduced a series of handy photograph cases for their salesmen. Each case is got up on the loose leaf style with leather covers and contains photographs of machine tools designed for special classes of work such as railway shops, general machine shops and structural steel plants. Each case is arranged so that it contains photographs of only those tools suitable for the one class of work.

The B. F. Sturtevant Co., of Canada, Ltd., Galt, Ont., recently sold an 8 ft. steel plate fan with engine and heater to the Toronto Street Ry.; heating and ventilating equipment for Pantages Theatre, Victoria, B. C., six large multivane type, motor driven fans with air washers and heaters for the Hudson Bay Building, Vancouver: a motor driven exhauster to the Jenckes Machine Co., Sherbrooke, P.Q.: heating and ventilating equipment for the Drummond Building and the St. Jean l'Evangeliste School, Montreal, P.Q.

"Safety First" Pays.—Eugene Lortie, Montreal, worked in the factory of Jean Baptiste Aubry. He drew the attention of the management to a defect in a machine. No action was taken. Later the employee lost three fingers. He demanded a lump indemnity, and a life pension. Usually, under the Workmen's Compensation Act of Quebec, the victim can only secure one of these sums, but in this case the employer had been guilty of inexcusable fault, and was ordered to pay both the lump indemnity and the pension. The repairs to the machine would have taken only a few minutes.

Information for Inventors.—Pigeon, Pigeon & Davis, patent solicitors, Montreal, report that 153 Canadian patents are issued for the week ending December 16th, 1913, 100 of which were granted to Americans, 32 to Canadians, 11 to residents of Great Britain and Colonies, and 10 to residents of foreign countries. Of the Canadians who received patents, 15 were residents of Ontario, 6 of British Columbia, 6 of Quebec, 3 of Saskatchewan, and 2 of New Brunswick. In the United States for the same week, 653 patents were issued, 11 of which went to Canadian inventors.

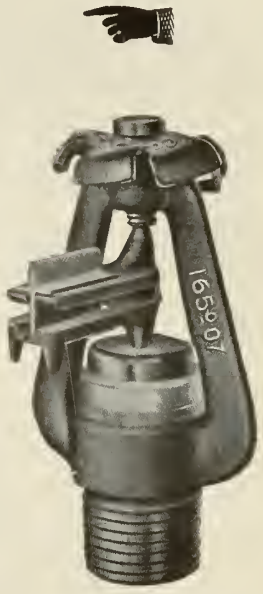
Estevan Lignite.—R. M. Blackburn, chief inspector of boilers for Saskatchewan, will leave shortly to conduct experiments with Estevan lignite coal at the plant of the Dominion Coal Co., Sydney, N.S. He will be accompanied by S. N. Darling, who is in charge of the Government experimental plant at Estevan, and the tests will probably cover the better part of two weeks. Three weeks ago, two carloads of carbonized screenings from the Estevan mines were shipped to the East, and this fuel is to be used in determining the efficiency of the fuel in a special type of furnace, only two of which are in operation in this country, and both at Cape Breton.

The Frost Wire Fence Co., Ltd., Hamilton, have adopted a profit-sharing policy, in which their wage-earners participate. Ont of their year's earnings a sum has been set aside for payment to their factory employees in preferred stock, in proportion to their years of continuous service, for one year and longer. One share of preferred stock has been allotted to each workman, towards the payment of which a credit of ten dollars has been allowed for every year up to five and over, total credit not to exceed $50. In succeeding years it is expected that a further credit of ten dollars each year will be given, and employees have the privilege of applying sums towards payment.

Personal

James Steele, president of the James Steele Wire Works, Ltd., Guelph, died at his home, December 30.

R. B. Angus, C.P.R. Director, etc., Montreal, has started on a world tour to occupy several months. He is 82 years of age.



W. F. Vilas, M.P.P. for Brome, Que., and proprietor of the Vilas Implement Works at Cowansville, Que., is very ill at his home.

A. R. Woolridge, manager of the scale department of the Canadian Fairbanks-Morse Co., Toronto, has gone to his home in Texas for a month's holiday.

Which Shall It Be?

The ———— Manufacturing Company's plant has been totally destroyed. A heavy blow because it is their extremely busy season.

A fire started in the plant of The ———— Manufacturing Company, but was quickly extinguished by their Automatic Sprinkling Apparatus.

Let us furnish you with estimates on equipping your old or new plant with

MANUFACTURERS' AUTOMATIC SPRINKLERS

Besides being a safeguard for your plant, they will enable you to effect a saving as much as 80% on your insurance premiums.

The General Fire Equipment Company
Limited

72 Queen St. East **Toronto, Canada**

"INGLIS"
CORLISS ENGINES

are known above all others as being pre-eminently "Engines of Quality," Economical, Durable and Reliable, and can be depended upon to give the same good results twenty years from now.

We build them Single, Tandem, Compound and Triple, for heavy or light duty. Remember our Fifty year reputation is back of every "INGLIS" engine.

Specifications and prices upon request.

The John Inglis Company, Limited ENGINEERS AND BOILERMAKERS

14 Strachan Avenue, Toronto, Canada

The Ideas That Create.

Why Business Men Are Big

The series of family sketches, running in MacLean's Magazine, are constructive timbers for the aspiring man to-day. If you have read the charming stories of the Oslers, the Denisons, the Bordens, the Allans, the Molsons, the Merediths, or the Prices, you will want to see in the February Number how the Gooderham qualities, laid by the Canadian founder of the family, have made and influenced the course of their subsequent business growth.

These descriptions are entertainingly written. The facts are obtained by a close personal study by the writers. The descriptions are not a fulsome screed on family virtues. They dip into and examine, commend or condemn as the point in question best appeals to good judgment. They take the reader for a pleasant biographical jaunt with the bypaths and lanes of personal endeavor and struggle, and point out to him the forces that contribute powerfully to the uplift of various members of the business or professional world.

The character sketches of Canadian people are masterpieces. You read in the January issue the meteoric rise of McCurdy, M.P., of Nova Scotia; The Poise of a Fraser,—Canada's Auditor General, a Conservative Liberal, in Blackadar of Halifax; or Culture in Professional Life—a sketch of J. Murray Clark, K.C.

In February, the enthusiasm that has made Wm. McMaster the latest addition to the directorate of the Bank of Montreal will attract and hold.

This series by Frederic W. Wile, Berlin correspondent of the London Daily Mail, on the great business and professional men of Germany, is alone worth any business man's attention. Von Tirpitz—the builder of the German Navy, in the January issue is followed by Von Bieberstein, the man who inspired the famous Kruger telegram in the February number.

The REVIEW OF REVIEWS section of the magazine culls gold from the literary wash of every country and interest. This alone is invaluable.

From four to six short stories. A humorous serial by Canon Hannay, and plenty of illustrations, conclude the attractions of an excellent magazine for busy Canadian men and women.

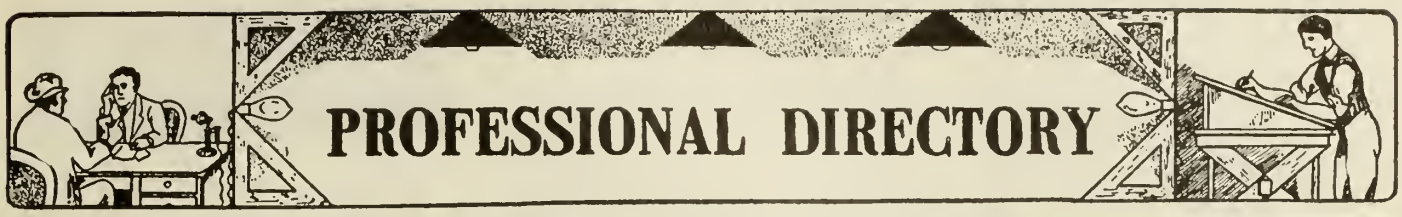
If you are not already a reader of MacLean's Magazine, we can commence your subscription with this issue. Send your name and address on a post card and have your copy sent at once.

Single copies 20c. *For one year $2.00.*

The MacLean Publishing Co.
LIMITED
143-9 University Avenue Toronto, Canada

J. C. Hance, Canadian manager of the S. F. Bowser Co., and members of the Canadian sales staff, are in convention at the home office, Fort Wayne, Ind.

Captain James B. Foote, manager of the marine department of the Toronto Insurance and Vessel Agency, has been recommended by the Dominion Marine Association as their representative on the Commission to be appointed by the Government to investigate marine wrecks and disasters on the Great Lakes.



Robert D. Bailey, foreman of the cogging mills at the plant of the Nova Scotia Steel and Coal Co., New Glasgow, N.S., was the recipient of an easy chair on Christmas Eve, the gift of his fellow workers in recognition of his ability, and friendship shown towards them in their work. Mr. Bailey is an old employee of the Company, having been working there for over a quarter of a century.

Catalogues

The Simplex Manual.—On the press, for the Simplex Wire and Cable Co., Boston, is a 92-page booklet which "just fits the pocket" as well as the needs of every electrical man who has anything to do with wiring problems. It is full of tables and other information of all sorts about insulated conductors and other matters electrical, and is equipped with an unusually complete index. Printed on a fine thin paper, and bound with stiff covers, the book is to be distributed gratis to those who ask for it.

The Dominion Machinery Co., Toronto, have sent us a pamphlet dealing with the "August" muffle furnace, for which they have the sole agency for Canada. The furnace is fully described, and illustrations given showing exterior views of some of the types. It is claimed that the firegrate is so constructed that considerable economy can be obtained in the consumption of fuel, which in this case is gas coke, and that the furnace can be re-fired while the work is in the muffle, the temperature of the latter not being affected. Copies of this pamphlet may be had on application.

Witton-James, Ltd., London, Eng., have sent us a copy of their latest catalogue, descriptive of the press-driving equipments which they manufacture. The catalogue consists of a number of leaflets bound together in a folder. It is devoted to various specialties such as rotary web and variable speed driving equipments, single phase motor equipments, electric motors and controls, etc. The various equipments are clearly il-

lustrated and accompanied by descriptive matter including suggestions for their application. In the motor sections are tables giving the principal sizes and weights of the various types and the loose-leaflet contains a list of equipments installed.

The Bury Compressor Co., Erie, Pa., have sent us copies of catalogues No. 40 and 41 dealing with the line of air compressors which they manufacture. No. 40 is devoted to steam, belt or motor driven single machines, while No. 41 deals with duplex compressors. The general construction of the machines is explained clearly, special mention being made of the principal features embodied in the design, two of these being the cushion poppet valves and force feed oil system. Both catalogues contain tables giving the principal dimensions of each type with illustrations, and copies may be had by interested readers.

The "Periodograph" or electro-mechanical time register is dealt with freely in a booklet which has been issued by the Grisholt Machine Co., Madison, Wis. The apparatus consists of a clock, switch board, registering machine and cards, and is designed for use in any kind of workshop, independently or in conjunction with the time recording system. The principal advantage claimed for the "Periodograph" is that it will record accurately the time taken to do any job, covering practically any period, with but two registrations, the start and stop. The "Periodograph" system is described in detail together with explanatory illustrations. The manufacturers will be glad to offer suggestions to interested readers as to how this system will fit in with existing time recording systems.

No. 15A. Weight 130,000 lbs.

For Fewer Wasters and Uniform Work

Bliss Toggle Drawing Presses

Blank holding pressure is taken by the frame, relieving bearings. Our patent toggle motion exerts a uniform pressure. Its action facilitates the work and requires less power. The work produced in every case is smooth and uniform.

The blank holder starts on its upward movement nearly simultaneously with the punch, giving the operator ample time for removal of drawn piece. Bliss Toggle Drawing Presses are built in many sizes and cover every requirement.

"Bliss Presses For Every Requirement."

E. W. BLISS CO., 20 Adams St., Brooklyn, N. Y., U.S.A.

Representatives for Chicago and Vicinity: STILES-MORSE CO., 565 West Washington Street, Chicago, Ill.

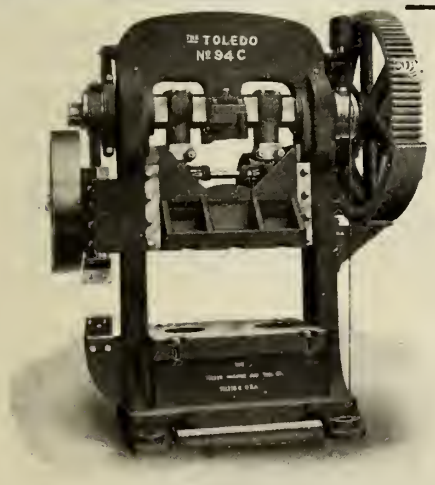
BLISS

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.



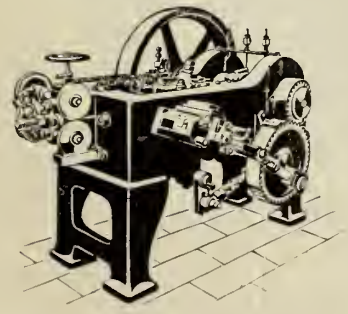
"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

"Toledo" Trimming Presses—



embody those features which the live manufacturer is looking for.

Outer Trimming Slide is fitted with **Adjustable** Steel Holders with **Positive Lock Nuts.**

New arrangement for gearing effects a great economy in floor space.

Fitted with the Toledo quick-acting, powerful Block Clutch which will stand more forge, shop dust, grit and abuse than any clutch ever designed.

RIVETING COSTS REDUCED BY "TOLEDO" WELDERS

No. 154 Welder, 36-in. Throat

The large daily output of many manufacturers of automobiles and auto parts has been made possible by the use of the "TOLEDO" Electric Welder shown here. With the increased output of their products, **costs have been reduced from 60 to 95%.**

We will prove this by shipping you a "TOLEDO" on 30 days' trial.

Write for our new Bulletins, Nos. 14 and 15. They tell all about "TOLEDO" Butt Welders and Spot Welders.

No Lease. No License. No Royalty.

Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.

Wrenches, Ratchet and Basin.
Bemis & Call Hardware & Tool Co., Springfield, Mass.

John Wanamaker says that advertising doesn't jerk — it PULLS. He ought to know, and yet some men think that advertising should go against all rules and precedents and jerk them to success with one tremendous yank.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

"W & B" Machinist's Knife Handle Wrenches

Tools of Quality

W & CO B

W&B

Bear These Marks.

The Bite That Holds

The essential feature of a good wrench is the ability to bite and hold the bite.

There's nothing to "give" in a "W & B" Machinist's Knife Handle Wrench, therefore the bite is always sure.

The ever increasing sales of "W & B" Wrenches prove a change of selection of wrench buyers who have not been using "W & B" Wrenches.

POWERFUL SENSITIVE DRILLS

MANUFACTURED BY

ALFRED HERBERT LIMITED

Real High-Speed Drilling

2,050 r.p.m. is the speed at which a ¼-in. High-Speed Drill will give the best results when drilling Cast Iron or Mild Steel.

It gives a surface cutting speed of 134 feet per minute.

Unless you are running your machines at this speed when drilling small holes, you are wasting time. Our Patent Ball-Bearing Drills have four spindle speeds—2,050, 1,370, 900 and 600 r.p.m., so that all sizes of High-Speed Drills up to 1-in. diameter can be run at efficient speeds.

The Ball-bearings run absolutely cold at all speeds and only require lubrication once a year.

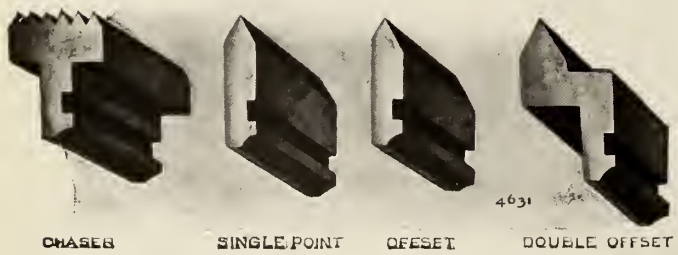
Builders of Machine Tools and Woodworking Machinery



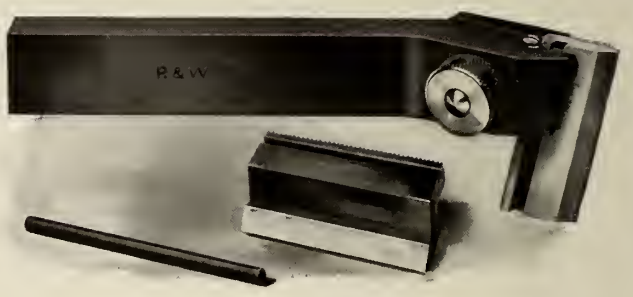
Use the P. & W. "Three-in-One" Lathe Knurling Tool

Carries three pairs of knurls making it three distinct knurling tools in one.

Why the P. & W. Threading Tool is Best

1. Threads can be cut very close to a shoulder.
2. Tools are sharpened by simply grinding off top of cutter.

Don't Waste Time Changing Knurls



and don't be bothered with three Holders when one will do.

Coarse, Medium and Fine

The three pitches of knurls which we carry in stock are all combined in this one tool.

Uses same knurls as regular Lathe Knurling Tools shown opposite.

3. Combines economy with all features essential in a threading and forming tool.

4. Cutters have 15 deg. clearance which experience has taught gives the longest wear in various metals.

Write for Catalog No. 7 "Small Tools" showing complete line.

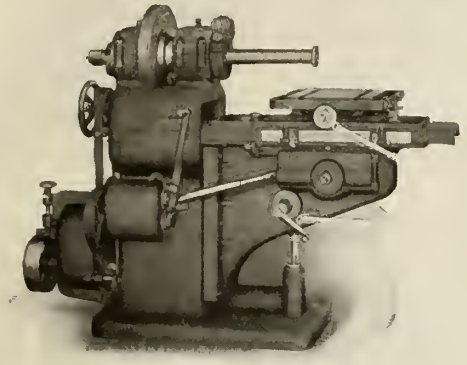
Cut Your Riveting Costs With a "TOLEDO" WELDER

No. 150 Welder.

This type of machine has been a genuine money-maker for stove manufacturers. The old-time method of riveting steel range bodies, stove runners, etc., has been replaced by "TOLEDO" electric welders in the largest plants throughout the country. A "TOLEDO" welder means a stronger, better and neater job at less than a third of the old cost.



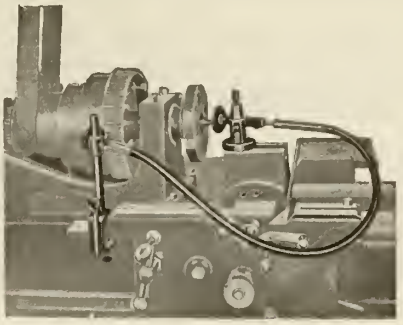
Let us ship you a machine on our free trial plan—then judge for yourself.

Just out — new Bulletins Nos. 14 and 15. Write for them.

NO LEASE. NO LICENSE.
NO ROYALTY.

THE TOLEDO ELECTRIC WELDER COMPANY
CUMMINSVILLE, CINCINNATI, OHIO

Better Work for Less Money



IS PRODUCED BY THE

Heald Cylinder Grinder

Designed from the ground up for internal grinding of gas engine cylinders, but most adaptable for finishing machine parts, such as large bearings, large cams, valves and pieces of irregular shape, etc. By means of the cross-slide table, two, three or four holes can be ground at one setting, accurate distances between centres and with perfect alignment.
Send for our booklet, "Cylinder Grinding"; it's free.

"I take great pride in it"

That's what one toolroom foreman says about his Milwaukee Universal Miller

Read His Letter

London, Ont., Nov. 10, 1913

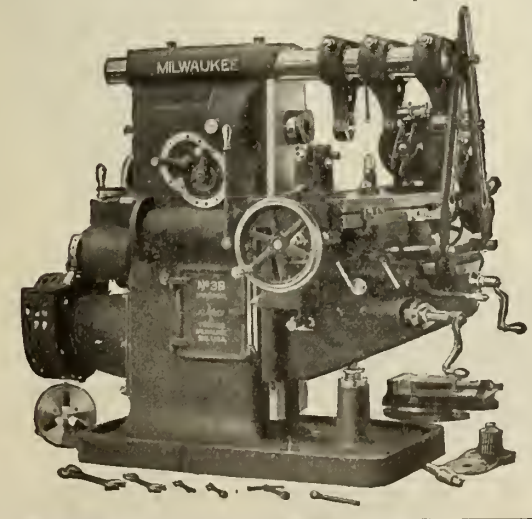
KEARNEY & TRECKER CO.,

Dear Sirs:

I am foreman toolmaker for the Spraymotor Co. of London and Buffalo. We have had one of your Universal Millers for two years and I take great pride in it because it is so easy to operate, so powerful and even, on light or heavy work. It has never bucked on any job yet. I certainly boost it every chance I get.

I would like you to send me any bulletins or new catalogues you may have out since 1912. I want to keep up with the times.

A. WEBB,
183 Ann Street London, Canada



Here Are a Few Reasons Why He Says So

Ease of operation is a prime consideration in every detail of Milwaukee Millers.

Every handle is located within convenient reach of the operator as can readily be seen by the illustration. Not only are the feed handles within convenient reach but also the handle for starting and stopping the machine. No countershaft is used to require attention and adjustment.

The spindle speeds are eighteen in number and are clearly indicated on a circular plate. These changes are in geometrical progression, each one being 1.25 faster than the preceding one.

The feed is driven from the constant speed gear on the feed box and the amount of power going into it automatically depends on the condition and requirements of the cut. No two feeds can be accidentally placed in operation at once. Twelve changes, in geometrical progression, are provided, ranging from ½-inch to 16-inch per minute without reference to speed of the spindle.

These changes are arranged so that each one is 1.35 faster than the preceding one.

The arm braces are light and easily applied. The operators do not neglect using them as is the case where the braces are made heavy and cumbersome.

These features of convenience are important reasons for the speedy production which makes Milwaukee Millers so popular with manufacturers as well as for the ease of operation which makes them so popular with foreman and operator.

Milwaukee Millers are powerful. The speed gearing is of hardened steel, arranged to give greatest power to the spindle drive.

The construction is massive and strong throughout. For instance, the column is a one-piece casting with a heavy ribbed base. The knee is a one-piece casting and its top plate is not weakened by holes or slots. The table is of semi-steel, finished on all sides.

All gears and bearings are kept free of dirt and foreign substances by a continuous cascade of lubricant. This system is made possible by our enclosed base. The oil reservoir will hold several gallons. The lubricant is pumped to the top of the machine, distributed through a perforated pipe, and cascades over gears and bearings on its way back to the base where it is strained and again pumped to the top.

This is but a brief summary of a few of the excellent points of Milwaukee Miller construction. The full facts are intensely interesting and important if you are looking for the very best in milling machines. *Write for our Bulletins.*

KEARNEY & TRECKER COMPANY

MILWAUKEE WISCONSIN

NICHOLSON MADE

FIRST—

Get the NICHOLSON-Made File That Best Suits Your Work.

THEN—

Use More of Them.

A dozen wrong-type files won't give you half the satisfaction of a single file that's right for your use.

When you specify NICHOLSON-MADE FILES, you simply can't go wrong.

Over 4,000 distinct patterns and sizes make it an easy matter to get the RIGHT file for your work.

And a NICHOLSON-MADE FILE represents the highest possible efficiency for its type.

Made from the RIGHT grade of steel—
Cut on our own special-built machines—
Inspected and tested after every important operation—
Embodying the results of 50 years in making great files,

each NICHOLSON-MADE FILE is a tool of matchless efficiency and economy in its particular field.

To get MAXIMUM File Service, use NICHOLSON-MADE FILES. To get the MAXIMUM service from NICHOLSON-MADE FILES, discard them as soon as they become half-worn.

The extra expenditure of 15c for a new file generally means a $1.50 saving in labor and time.

There is no Backing Out

Where **GEOMETRIC ADJUSTABLE COLLAPSING TAPS** are used.

They are made to collapse their chasers automatically. Thus, when the desired length of thread has been tapped, the Tap is withdrawn without touching the finished thread.

Can be applied to Turret Head Machines or Live Spindles.

When the chasers become worn beyond regrinding they are renewed at small cost, and the Tap remains as good as new.

GEOMETRIC COLLAPSING TAPS HAVE EVERYTHING TO RECOMMEND THEM.

Write for descriptive Booklet.

Getting a Starrett for that "Special" Big Job

For the large work in your shop that must be measured with micrometer accuracy the ordinary one and two-inch machinist's micrometers are too small. You must have in the tool room a micrometer which gives perfect accuracy and wide range. This

Starrett
Government Micrometer

is a tool room micrometer made for large work. It was made to suit the requirements of the Ordnance Department of the United States Government and many of them are now doing service there. The micrometer frame is cut from steel plate and is covered with hard rubber to prevent expansion from the warmth of handling. This government micrometer is made in three sizes, No. 127 A 0 to 4", 127 B 4"-8", and 127 C 8"-12". The micrometer adjusts 1" reading 1-1000". Tail spindles forming anvils are provided and these may be quickly attached to the micrometer, making it possible to measure the work without turning the spindle more than 1".

42-196

Let us send you Catalog 203 describing the full line of Starrett Tools

TRY THIS DRILL ON THE HARDEST WORK YOU HAVE IN YOUR SHOP

The efficiency of a drill means its accuracy, its cutting ability and the amount of work it can do well without regrinding.

The Wilt Twist Drill is made by a new process—a process that completes the drill at a single chucking.

This means accuracy and uniformity to a marvelous degree and when coupled with scientifically accurate hardening, in an electric furnace, produces a drill that is efficient to the highest degree.

Use the Oil Engine for Power

Where an adequate supply of oil is available, the Fairbanks-Morse Oil Engine has many striking advantages over any other type of engine for power. Some of these advantages are portability; cleanliness; automatic operation, requiring no licensed engineer or skilled attendant; low fuel cost; no expense when not running; absolute safety; no danger from fire, and thorough reliability.

FAIRBANKS-MORSE OIL ENGINES

Will operate successfully on 72 per cent. of the oils distilled from the average crude.

These engines are built in all the common sizes from 2 horse-power up.

The usual excellence of design, careful workmanship and superior materials enter into the construction of Fairbanks-Morse Oil Engines, guaranteeing their service.

Many plants in Canada are now operating our Oil Engines.

You will find it to your interest to get in touch with us. Ask for **Catalogue 52.**

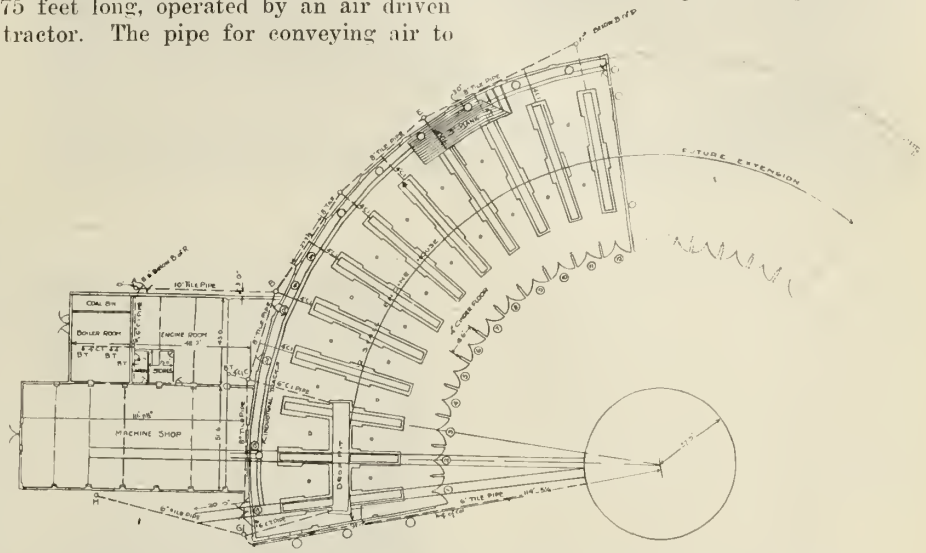
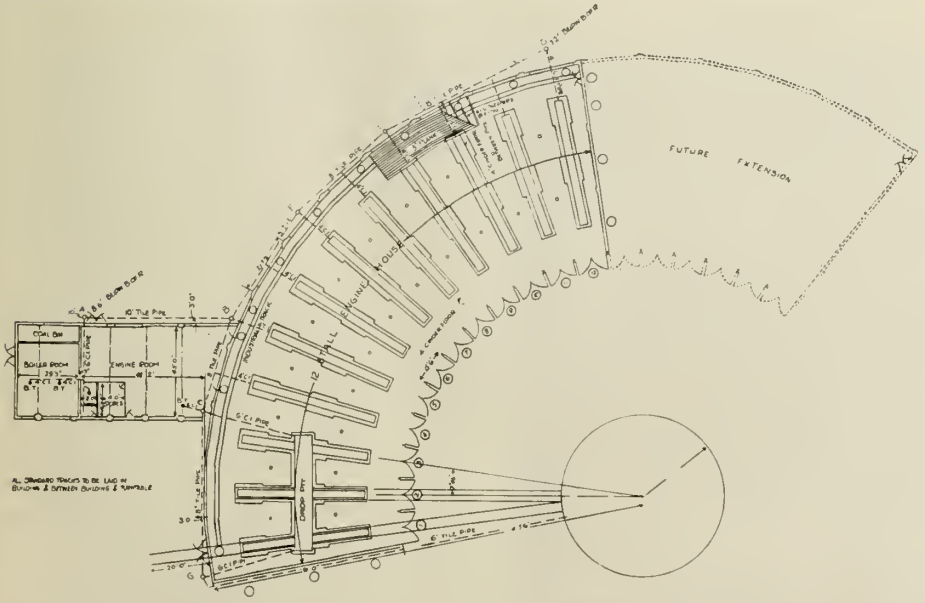
Round Houses on the National Transcontinental Railway



By C.T.R.

There is here given an interesting and highly instructive account of a needful accessory of any railroad worthy the name, but more particularly so of those which stretch from the shores of the Atlantic to the Pacific in this Dominion. To those unacquainted with round houses and their equipment, and the work performed in keeping our locomotives always fit, the article furnishes valuable data, and gives a clear insight into the reason why we in Canada, with a varying temperature on a 3,000 miles ride have maintained for us so efficient and reliable a railroad service.



WHEN the National Transcontinental Railway comes to be opened, a traveler from Moncton, N.B. to Winnipeg, Man., may be surprised to hear that his train was pulled over the various divisions of the line by a total of fifteen engines. This means that counting in the two terminals, there are sixteen round houses each supplying a locomotive to any continuously run west-bound train, with, of course, the same for east-bound traffic. The distance between Moncton and Winnipeg is 1,800 miles, and the round houses are spaced so that a fair average of 120 miles may be said to be about the distance between each.

Starting them from the east, they are Moncton, Napadogan, Edmundston, Monk, "Bridge," (i.e., near Quebec), Fitzpatrick, Parent, Doucet, O'Brien, Cochrane, (named after the Minister of Railways), Hearst, Grant, (named after the Chief Engineer of the Commission), Armstrong, Graham, (named after the former Minister of Railways) Redditt and Transcona, (near Winnipeg.) The latter name is, of course, an abbreviation of the word "Transcontinental."

Without counting the "Leonard" shops at Quebec or the Transcona large repair plant, there are six round houses with machine shops attached. Each round house has 12 stalls and each is equipped with all necessary appliances, such as boilers, feed and washout pumps, air compressor, electric generator for lighting, heating apparatus, and a well-planned drainage and sewer system. Each round house has a turn-table about 75 feet long, operated by an air driven tractor. The pipe for conveying air to the turn-table tractor is carried to the turn-table pit, and is brought up at the centre of the turn-table. The pipe is fitted with a ball and socket connection which enables the table to be swung round by the tractor. The old-fashioned time-consuming hand labor is thus dispensed with, by the use of this satisfactory and efficient appliance.

N. T. R. 12-STALL STANDARD ENGINE HOUSE WITH MACHINE SHOP.

N. T. R. 12-STALL STANDARD ENGINE HOUSE WITHOUT MACHINE SHOP.

Round House Equipment.

The equipment of the round houses with machine shops is adequate to the work to be done, and taking Grant, Ont., as a typical case, it consists of one 28 x 16 in. gap lathe; one portable 14 in. bolt lathe; one 20 in. vertical drill; one 16 in. crank shaper; one pipe machine 1 in. to 4 in.; one single bolt cutter ½ in. to 2 in.; one 6 in. x 36 in. grindstone; one double emery grinder with 16 in. wheels; one circular forge; one forge blower; and one anvil. This is practically the equipment for the machine shops; although perhaps slightly modified here and there by the substitution of one machine for another as circumstances directed.

These machine shop round houses are so placed as to be in the centre of an east and west operated division. In this way no locomotive is ever more than the length of one division away from a machine shop. Efficient repair work can thus be done economically, and without necessitating long mileage under reduced load, due to deterioration of power after long service; or in case of break-down, the light mileage is reduced to a minimum.

All the round houses are equipped with drop pits of modern design, and all are, in addition to their supply of compressed air, provided with hot and

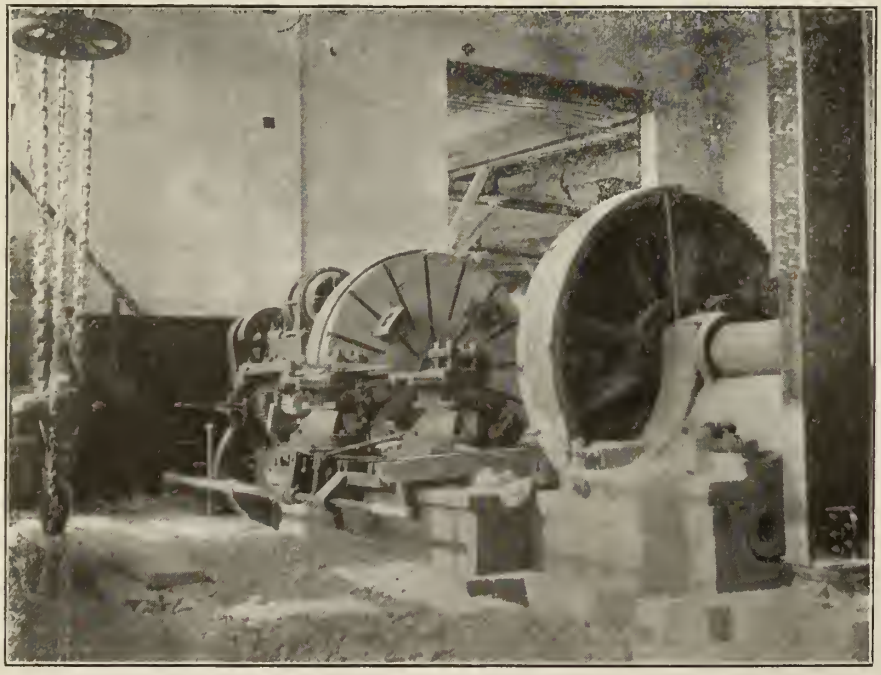
cold water. The pipes are run overhead, and are brought down the side of some convenient post where readily-made connections enable workmen to repair

N. T. R. ENGINE HOUSE AT COCHRANE.
GENERATOR AND SWITCHBOARD AT COCHRANE. 4" DRILL, JIB CRANE AND 80" WHEEL LATHE.

the engines, and the boilers may be washed out, filled or otherwise "got ready" for the road. The round houses are lighted by electricity: convenient drop and portable lamps are also provided. The machine shop round houses are electrically equipped for driving the machinery, so that all kinds of work can be done with great facility and economy.

Heating Provision.

The engines are headed in to the round houses, and the smoke jacks are at the lower ends of the roof. Ample space in front and at the sides of the engines is thus secured. The heating of all the round houses is by hot air. Pure air from the outside is made to pass over coils heated by exhaust steam from the air compressor and the electric generator engines. When necessary direct steam from the boiler can be made to supplement the heat derived from the exhaust, so that by the operation of a large fan, a constant stream of hot air is circulated in the round houses. The hot air ducts discharge into the pits through three openings on each side, so arranged that the engine-truck and the "machinery" of the locomotive receive heat close to where they are placed on the pit. These are the parts which give most trouble in the winter by freezing. The third duct discharges in the vicinity of where the tender stands.



In this way an engine clogged with snow and ice and with the "motion" frozen up, is very quickly thawed out while standing on the pit, and in case of necessity or emergency, and in order to save time on an engine required for service soon after its arrival, the tank can be filled from the shop water service while it is standing on the pit, thawing out.

A Waiting Track.

A very noticeable and unique point

LOWER HAMMER. PUNCH AND SHEAR.

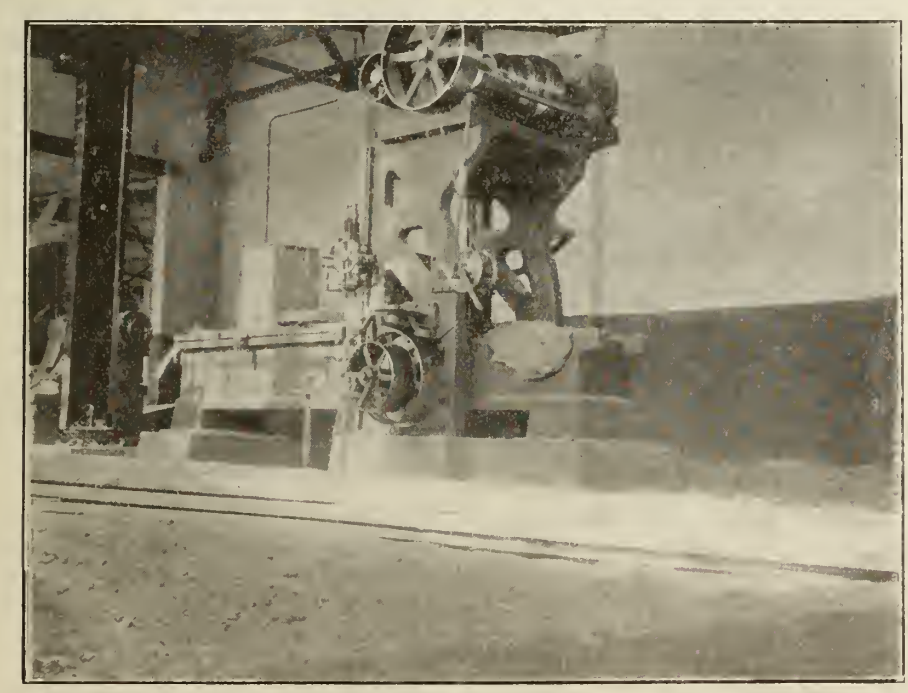
N. T. R. ENGINE HOUSE AT COCHRANE—MACHINE SHOP SHOWING 80" WHEEL LATHE.

connected with the round houses recently constructed by the N. T. Ry. is the track which passes right through the round house, from back to front, along one of the walls. To this track there is an entrance from the turntable in the usual way. The track lies beside the drop pit, and a door is provided in the back wall. This arrangement permits a disabled engine to stand outside, until the round house staff is ready to receive it, and while so standing the engine does not block any track nor interfere in any way with the ordinary operations involved in handling engines. When required, and if a shunting engine is not available, the disabled engine can be "pinched" inside the shop, and work proceeded with at the convenience of the mechanical department, without delay and without having to depend on outside assistance, which may be hard to get at certain times.

This arrangement is most useful from an operating point of view, as it deals with railway work, not as it theoreti-

cally should be, but as it actually is. The appreciation of this point speaks well for the forethought and the accurate, practical knowledge of things as they are, and of the contingencies which constantly arise in the daily work of a busy round house.

Round House Doors.



Another feature that has been carefully worked out is the round house doors. These are substantially made and well braced, so that the almost universal tendency of the doors to sag at the point has been practically eliminated. The doors fasten easily and firmly inside at the middle and at the bottom in the usual way, but the top has also been provided for. The tendency of all round house doors is to warp and gape open at the top, and, when this occurs, it is difficult to close them properly. A great amount of heat necessarily escapes uselessly, and the condensation and the drip thus caused usually freezes in a small but troublesome hillock of ice on the track. This ice must be removed before the doors can be opened. In order to prevent this delay, the top of the doors are locked by a bell crank, shod with a small wheel which, acting on a suitable bevel plate, draws the doors tight shut at the top, and holds them there.

The constant fastening of the doors, top, middle and bottom, reduces the tendency to gape and ensures a really tight-closed door every time it is drawn up. The gaping of a door even a few inches, may not, in an individual case, cause much loss of heat, but when it is remembered that each round house has many doors; that there are many round houses on the road, and that during the whole winter, several doors are bound to gape in each round house, the aggregate amount of lost heat becomes very great. It is cumulative effects of these small losses both in waste heat and the time expended in chopping ice at the doors, which brings this simple device up to the level of a necessary, practical and efficient piece of round house design.

The Directing Minds.

The work of construction of these round houses and small machine shops, and the many and important other practical matters connected with the building of the road as a whole, has been done under the careful and efficient supervision of Mr. Gordon Grant, the Chief Engineer. The practical, and one may almost say, the many operating details as well as the layout, design and equipment of the round houses and the machine shops attached, has been done by Mr. W. J. Press, the mechanical engineer of the Commission, who also designed, built and equipped the large shops at Transcona and is handling the "Leonard" shops at Quebec in the same efficient manner. It is to his intimate knowledge of the needs of the operating staff, working in all weathers, under varying conditions, and amid contingencies which daily arise on a railway, that the many economical features to be seen in the shops must be attributed.

Major R. W. Leonard, Chairman of the National Transcontinental Railway Commission has not only carefully examined the designs of all the shops, round houses and repair plants and the other details of road construction, but has carefully scrutinized the cost of installation and has weighed the reasons for the adoption of the various arrangements which, now that the railway is approaching completion, make it evident that the government have provided a thoroughly up-to-date railway line; and the people of Canada will have every reason to feel satisfied with the quality of the work done, and the intelligent provision for the future needs of the railway which is intended to serve a rapidly growing population in regions which would long have remained unproductive had it not been for the conception and the steady and efficient construction of the National Transcontinental Railway.

N. T. R. ENGINE HOUSE AT COCHRANE —MACHINE SHOP SHOWING 30" PLANER AND BOTTOM OF JIB CRANE.

FAMILIARITY BREEDS CONTEMPT.

An inspector going through a plant in Illinois observed a set-screw projecting on a revolving shaft. He considered it particularly dangerous because the shaft was near a passageway and workmen were continually going back and forth past it. He called the manager's attention to it. "Don't you think," he said, "that that set-screw had better be cut off? Someone will get hurt some day if it is left that way." "I don't think so," the manager replied, "that set-screw has been like that for years. No one has ever been hurt by it. The fact that it is exposed and can be observed by anyone renders it safe from causing an accident." This manager had a habit of gesticulating when speaking, and, as he waved his arm to emphasize what he was saying, the sleeve of his coat came in contact with the set-screw and caught on it, and in an instant he was whirled to death.

RAIL MILL SHUTS DOWN TEMPORARILY.

The Dominion Steel plant rail mill shut down on January 8 for repairs. General Superintendent Martin said:— "This is only for temporary repairs which could not be made with the plant running. You may be assured, however, that by the twenty-sixth of this month, the works will again be in operation. It will please you to know that while, in common with many firms, in the summer time, on this continent, the Steel Company has felt the existing depression, all signs now indicate that 1914 will be a most prosperous year, and our company will naturally have its share, and thereby an exceedingly busy time throughout this year."

Continuous Manufacturing by Sequence of Operations*

By Oscar C. Bornholt

Continuous manufacturing appeals to all manufacturers who have a product requirement large enough to carry out the idea. The paper outlines such an arrangement of machines in use by a manufacturing plant that has been phenomenally successful.

CONTINUOUS MANUFACTURING.

IN any manufacturing enterprise, the cost of production is very important, and a great deal of money can be wasted if proper facilities are not provided. Even though a plant has the very latest and most efficient machines and fixtures, money can be unnecessarily spent in trucking. Trucking in the machine shop is always looked upon as an unnecessary expense, and yet many plants have a large trucking expense. This involves the question whether the manufacturing machines in a machine shop should be laid out in accordance with the sequence of operation, or whether they should be grouped according to the class of operation requiring like machines, such as placing together all milling machines, all drill presses, etc.

I will endeavor to show that the arranging of machines according to sequence of operation, as practised by the Ford Motor Co., has a great advantage over the classified machine grouping. In the former case, the operations on any part to be manufactured can be outlined according to the best advantage in manufacturing the part. It might be well, on account of the nature of the part to be manufactured, to have a milling operation first, then drilling, then milling, and it would not make any difference what sort of machine followed on each operation, but if the latter arrangement of grouping were decided upon, the operations would have to be arranged so that like operations on the same part would follow each other. For illustration, a milling operation should not come between two drilling operations so that the part would have to be trucked to the drill department first, then to the milling department, and then back to the drill department. Trucking is expensive and all its labor is non-productive.

The trucking item is immense in a large plant when the machines are arranged according to class, as all parts have to be trucked many times before they are finished. When machines are placed according to sequence of operation, there is no trucking of parts after the first operation is started, as each operator lays the part down in such a place and manner as to allow the next operator to pick it up and perform his operation, and so on. When finished, the part goes either to the finished stock room or assembling department.

Continuous Manufacturing Examples.

A good example of continuous manufacturing is found in the making of tin cans. The body of the can is started at one side of the building in a machine for forming it; it next goes to the body-soldering machine and then to the header which has been fed with the two heads; when the heads are on, the can travels upstairs to have these soldered. The first machine sets the pace and the operators of the other machines must keep their machines moving at a similar rate so that the stock will not run short or accumulate. This arrangement, therefore, helps to increase production.

At the Ford plant, the machines are arranged very much like the tin-can machines. All parts of a unit assembly are made on machines that are so laid out that the last operations bring them near together. This applies, of course, only to the large pieces, but all parts of a unit are made in one department under a foreman. Automatic screw machine parts are made in an automatic screw machine department where one man runs several machines. There would be no object or advantage in placing automatic machines among semi-automatic and manual operative machines. It is well understood that there are many operations that require more than one machine, but they are placed to draw from the one machine doing the previous operation. This gives the effect of the whole operation being done on one machine. The operations have to be gone over carefully to ascertain the capacity either by previous records or by good judgment. In many operations, more than one machine will be required, but there will not be work enough for two. Although the first cost may seem high, it is a great saving to have a machine for every operation and enough of them.

The carbonizing and hardening operations are awkward to have in the machine shop, but at the Ford plant a cyaniding and hardening department is placed in the middle of the machine shop.

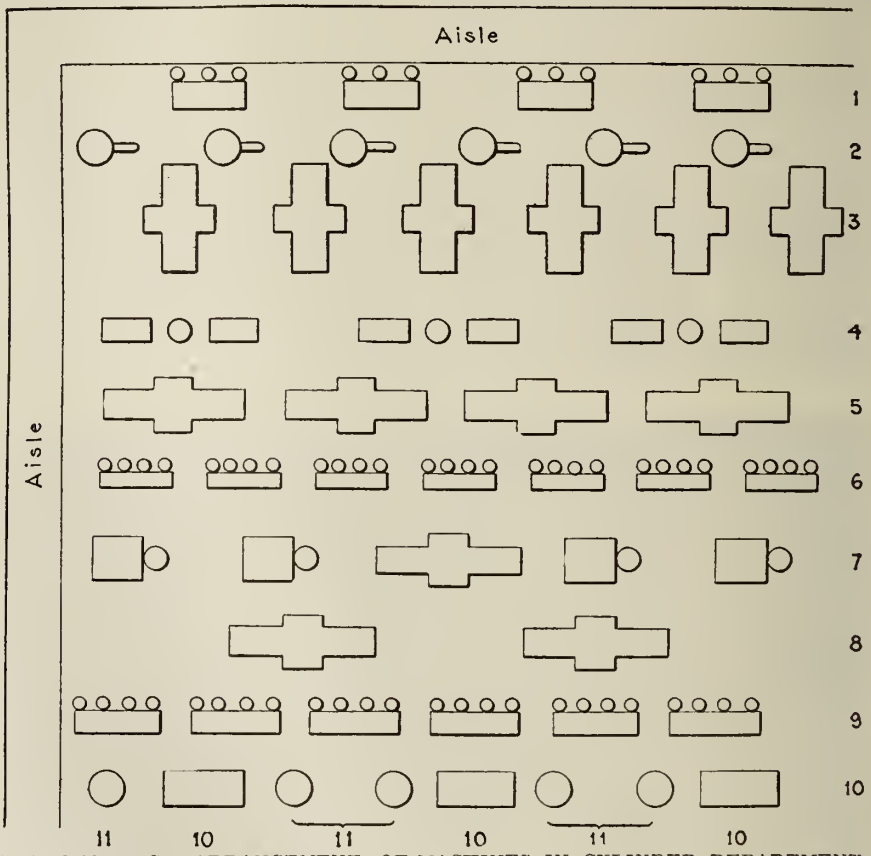


FIG. 1. SEQUENCE ARRANGEMENT OF MACHINES IN CYLINDER DEPARTMENT.

*From a paper read recently before the American Society of Mechanical Engineers.

It is glassed in and thoroughly ventilated with a separate system to carry off the fumes from the cyanide pots. All parts to be cyanided and hardened are led up to this department, and, thus, trucking amounting to several hundred tons of material a day to a separately located building is avoided. On account of the great amount of heat generated, the heat-treating and carbonizing departments had to be placed in a separate building where the walls could be opened 60 per cent. Brazing is done in the machine shop, just before the parts reach the assembling department. All shop furnaces are operated with low-pressure air —1½ lbs.—and city gas.

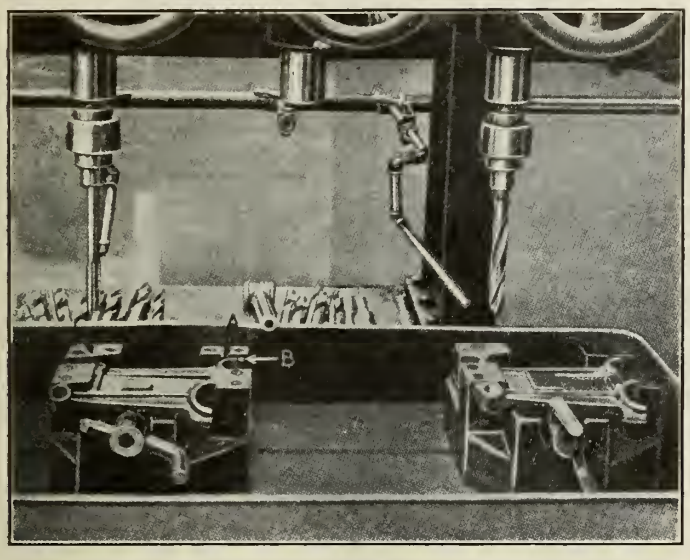

FIG. 2. DRILLING AND REAMING PISTON PIN HOLES.

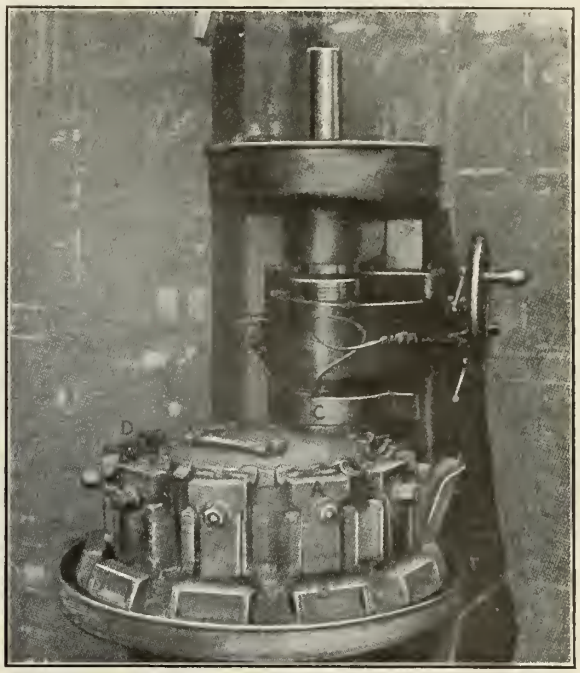

FIG. 3. CONTINUOUS MILLING OF CONNECTING ROD ENDS.

Illustration of Unit Production.

As an illustration of unit production, I will take the universal joint which has only four pieces and four rivets. Assuming that a production of 80 pieces per hour is required, it would take

80 universal joint knuckles, male;
80 universal joint knuckles, female;
160 universal joint knuckle rings, halves; and
320 rivets.

The universal joint knuckle, male, has six operations, as given in Table 1.

Table 1—Operations on the Universal Joint Knuckle.

Operation.	Work.	Machines Required.	Capacity, per Hour.
First	Mill square end	2 Millers	40
Second	Turn to size, 3⅛ in. diameter	1 Lathe	80
Third	Turn trunnion ends	2 Duplex drills	40
Fourth	Mill ends, shoulder clearances	2 Millers	60
Fifth	File	Bench for filing	..
Sixth	Harden	Furnace in the hardening room in the machine shop; knuckle to be returned to assemble	..

The operations on the universal joint knuckle, female, are similar. The rings are broached, and then ground on a disc grinder, which is placed in the machine shop. The grinder is equipped with a dust exhauster and collector so that no emery dust flies to other machines. After all the parts are completed, they are led up to an assembler who also rivets them. They are then inspected and sent to the finished stock room or the assembling department, usually the latter, since the production of the whole shop must be balanced up.

At the Ford plant, the cylinders are trucked from the foundry to the border of the aisle, down which are located the machines which perform the first operation. They are light enough to be carried by the operators to their machines while the latter are making cuts. The cylinders move to each successive machine until they land in the assembling department which borders the cylinder department. All cast iron parts are made in the same way. Some of the small parts have to be trucked to the assembling department, but in rare cases only. The trucking done at the Ford plant is taken care of by many two-ton monorail traveling hoists operated by electricity and forming a small railway system.

Cylinder Department Operations.

An illustration of the cylinder department for the first few operations is given in Fig. 1.

First operation—Drill, tap and plug three cored holes.

Second operation—Spot, face and inspect. This is one of the most important operations on the cylinder, since it detects any defect that might have occurred in the foundry. It also finishes spots to enable the placing of the cylinder in the jigs quickly and accurately. Many cylinders are thus saved in this jig because it is arranged to adjust the cylinder to ensure its being finished all over.

Third operation—Mill bottom.

Fourth operation—Drill six main bearing bolt holes and ream two of the holes for use in gauging or jigging. The drilling is done in a six-spindle inverted drill press and the two holes are reamed in a single-spindle drill press.

Fifth operation—Mill top and sides.

Sixth operation—Bore cylinder barrel.

Seventh operation—Water test

Eighth operation—Mill ends of cylinder.

Ninth operation—Finish ream barrel.

Tenth operation—Drill valve seat holes

Eleventh operation—Drill and ream valve-stem holes, etc., until the cylinder reaches the assembling department.

Machine Arrangement Comparison.

It may be of interest to compare the two ways of arranging machines for manufacturing by using the cylinder operations of various kinds. In placing the machines according to operation, it is necessary only to truck the cylinder to the first operation and after the last, because it is quite necessary to stock a few cylinders ahead of assembling. If the cylinders were to be machined in departments consisting of like machines, it would be necessary to truck to and from each department. Considering 1000 cylinders a day and the cylinders weighing above 80 lb. each, it would total 80,000 lb. to each department.

Grouping the operations on the cylinder to see how many times it is handled and in how many departments, there are drilling, milling, lathe, testing, tapping, babbitting, back to drilling, and grinding. It would be conservative to estimate that the cylinder would have to be trucked about 12 times. On account of some operations, it would have to return to a department in which it had already been, and would therefore be handled more times than there are departments.

Each handling will amount to 80,000 lb., or 40 tons, and 12 handlings will amount to 480 tons a day, while the total number of feet of movement for each cylinder will be at least 500. This makes 480 tons traveling 500 ft. at the probable rate of 180 ft. a min., which is about the gait of a man trucking. Assuming a man can truck 960 lb., or 12 cylinders, at the above rate of travel, and figuring the necessary time for loading and unloading as 10 minutes, it would require a force of 24 men with trucks to handle the 1000 cylinders per 10 hours.

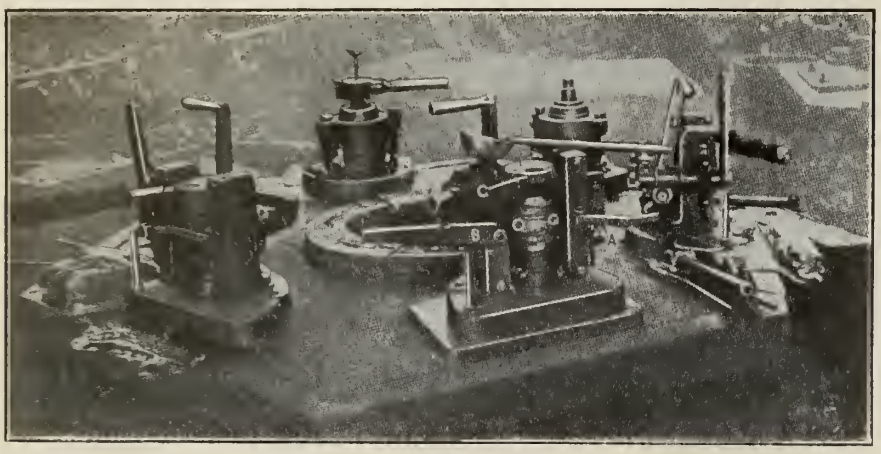

FIG. 4. ONE OF THE BABBITTING FURNACES FOR RODS AND BEARING CAPS.

Production of Small Forgings.

While it may be claimed that the cylinder is especially adaptable to manufacture with machines placed in accordance with the sequence of operations, small forgings can also be produced in quantities much cheaper in the machine shop when the machines are placed in this way. The machining of connecting rods show how this system is applied where comparatively small forgings are used. These are brought in from the forging shops, and begin their passage down the row of machines which are arranged for the various operations. Nearly all of the machining operations consist of drilling, and the rods pass from one machine to the next, each being fitted to perform a specific operation. A typical view is shown in Fig. 2, where the wrist or piston pin hole is being drilled and reamed.

Adjoining this is a continuous milling machine shown in Fig. 3, the correct length being secured by having the piston pin hole slip over a suitable stud at the lower end of the fixture. The rods are held in pairs, as can be seen. As soon as the connecting rods are ready to receive the babbitt, they have reached one of the babbitting furnaces, shown in Fig. 4, which is very near to the last machine. The particular furnace shown happens to be babbitting the caps for the bearings, but is exactly similar in detail to the one which babbitts the connecting rods themselves. After babbitting, the rods are bored, and are then complete and ready to go to the assembling department.

There is another advantage in placing the machines in accordance with the sequence of operations, because, even though some machines are not worked to their full capacity, the amount invested in them is well paid for from the fact that it is not necessary to carry nearly so much stock as when the machines are grouped according to their classification. Each group or department alone would in that case need to have nearly as much raw stock to work with as is necessary with this method to operate the whole series of machines to complete the part.

GROWTH OF THE DOMINIONS.

HOW the King's Overseas Dominions have developed in fifteen years is set forth in the "Statistical Abstract for the several British Self-governing Dominions, Crown Colonies, Possessions, and Protectorates," just issued by the Board of Trade.

Exclusive of the United Kingdom, the area of the Empire is now approximately 11,253,000 square miles. In 1897, the population of this vast territory numbered 307,476,000. The figures for the last year are, of course, estimates only:

	1901	1912
Canada and Newfoundland	5,592,299	8,003,137
Commonwealth of Australia	3,773,801	4,733,350
Union of South Africa (1904)	5,175,824	6,211,900
New Zealand	772,719	1,052,627

In fifteen years the public revenue of Canada has grown from £8,382,000 to £34,675,000.

The following table shows the development of trade between the Mother Country and the principal parts of the Empire in the fifteen years covered by the return:

Imports From United Kingdom.

	1898	1912
British India	£40,218,301	£91,690,228
Australia	20,975,551	39,124,829
Union of South Africa	15,255,000	23,200,948
Canada	6,753,289	28,723,812
New Zealand	5,148,833	12,499,787
West Africa	2,766,000	8,203,000
West Indies	2,510,900	3,766,974

Exports to United Kingdom.

	1898	1912
British India	£23,468,005	£45,897,819
Australia	23,886,313	31,459,317
Union of South Africa	25,690,000	56,121,502
Canada	21,575,108	36,585,189
New Zealand	8,265,499	16,861,256
West Africa	1,781,000	5,855,000
West Indies	1,460,659	2,287,224

Imperial Mail.

Post Office business has fully kept pace with developments in other directions. Appended are some of the principal figures relating to letters and cards alone for 1912, together with the corresponding totals for 1901:

	1901	1912
British India	469,209,000	850,889,000
Australia	220,852,000	479,672,000
Canada	229,859,000	652,153,000
New Zealand	54,089,000	225,436,000
South Africa (1902)	42,400,000	130,788,000

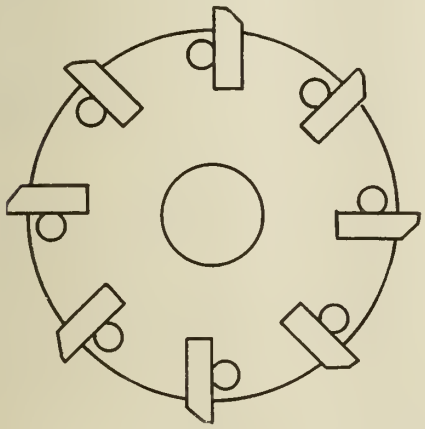
Growth of Railways.

In the period under review the railways of the Dominions have been extended by many thousands of miles, and vast tracts of country have thereby been opened up for settlement. The following table affords an indication of the extent of the development since 1898:

	1898. Miles.	1912. Miles.
British India	21,930	33,484
Canada	16,718	28,035
Australia	12,483	18,679
Union of S. Africa	2,862	8,393
New Zealand	2,257	2,889
Rhodesia	586	2,358

Hamilton, Ont.—The Dominion Power and Transmission Co. have awarded the contract for electrical machinery to develop 90,000 h.p. at its new steam reserve power plant on the bay shore to the Canadian Westinghouse Co., Hamilton. The order for boilers has been let to the Edge Moore Iron Works, Edge Moore, Del.

MACHINE SHOP METHODS AND DEVICES



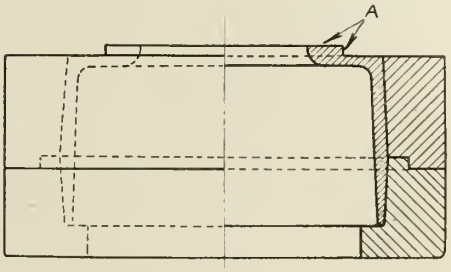
Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

HOLDING THE TEETH OF MILLING CUTTERS.

D. S. Mann.

FOR fastening-in the teeth of milling cutters and boring heads, an excellent method is shown in the drawing. This is by means of straight pins which are put in at a slight angle to the face of the cutter, about two degrees. The holes are first drilled at the desired angle, preferably in the milling machine, using the dividing head so that the pins are driven in, being straight round pieces of drill rod preferably, although cold rolled steel will answer if the pins are not to be driven out often. Pins ⅜ in. in diameter are suitable for medium size cutters.

The body of the cutter is then slotted for the blades, the proper angle for the pins being milled at the same time. There is thus no fitting necessary on the pins as they come exact, but they should be marked so that each may be used on its own blade. The less the angle the greater the holding power of the pin and vice versa, also the farther the pin may be driven. If the blades are to be set at an angle, it is only necessary to drill the holes at that much greater angle. This

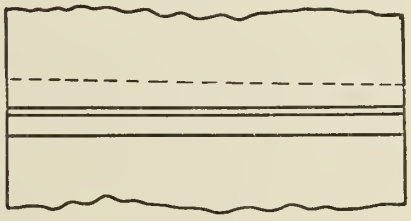


HOLDING THE TEETH OF MILLING CUTTERS.

is one of the simplest and easiest methods of holding blades, as all fitting and extra work is eliminated, only the drilling and milling being necessary.

A CHEAP PULLEY.

By D. O. Barrett.

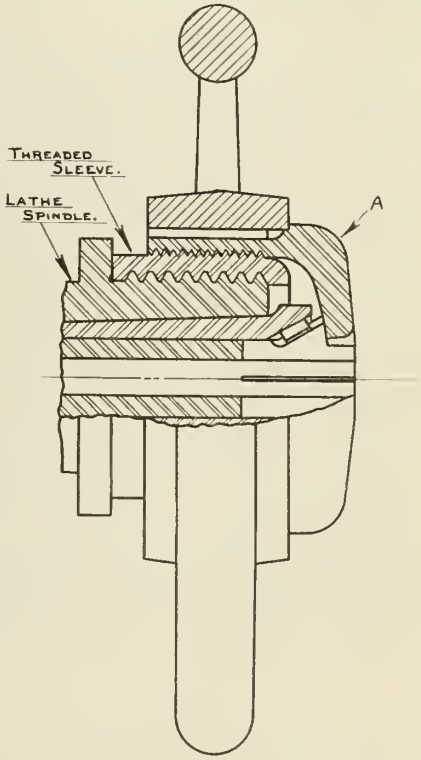


IN putting out a line of gasoline engines, it was decided to use interchangeable pulleys, bolting same to the flywheel by means of three capscrews. As the engines were put out as cheaply as possible consistent with the workmanship, it was decided not to machine the face of the pulleys. In order to get a smooth and true surface, the pulleys were cast in iron chills as shown in cut. The chill was heavy enough to prevent

A CHEAP PULLEY.

any distortion, and these chills have now been used for some time without any bad results. In order to crown the pulleys, the chills were made in two pieces, being turned with shoulders fitting properly.

For machining, the pulleys were grasped in a three-jaw universal chuck with soft jaws and the faces at (A) turned.



As the pulley sat in the flywheel only about one-sixteenth of an inch it was not necessary to form a square shoulder, merely facing and turning to the proper diameter. The pulleys came out smooth and very round and no trouble was experienced with any of them. They were dumped out of the molds almost immediately after pouring, it being necessary to use very hot iron with a high head. The chilling did not in any way affect the turning.

A DRAW-IN CHUCK.

By D. O. Barrett.

ON account of a great deal of work which required to be done on valves, studs, shoulder pins, etc., the draw-in chuck shown by the drawing was constructed for use on a 12-inch engine lathe. Some of the work came through in large quantities and, as this was the only machine suitable for the purpose, it was necessary to have the operator make as few movements as possible. Were this chuck made as ordinarily used the head-wheel would have been placed at the outer end of the spindle and the operator would have to step out of his working position each time he changed his work. By having the handwheel directly on the nose of the spindle it was

A DRAW-IN CHUCK.

handy for the operator and necessitated no change in position to reach same.

A tapered sleeve was slipped into the lathe spindle and bored out as large as possible with a straight hole for the collets. This sleeve could be fairly thin as most of the strain was at the front end. This end was bored to the same angle as the heads of the collets, the collets being provided with four slots to allow for the clamping action. On the nose of the spindle was screwed a sleeve, threaded

internally to correspond to the spindle and externally with a finer thread. This sleeve was screwed up tight and also released with the aid of a spanner. Turning on the sleeve is the piece (A) threaded to correspond to the sleeve and projecting over the ends of the collets.

It will be noticed that the collets have a straight portion extending through this piece (A). This was to support the stock as much as possible and prevent any overhang where it would be impossible to get at it with the cutting tool. Keyed to (A) is the handwheel which, when revolved, in the direction opposite to the motion of the spindle causes A to be screwed up on sleeve and, in turn, force in the collets.

This style of chuck is more applicable to the larger sizes of lathes, because on many of these the spindle does not run entirely through, being provided with a thrust bearing directly against the outer end of the spindle. It can also be applied just as well to a solid spindle, so that it would be possible to handle short pieces of round stock.

ROLLER AND BALL BEARINGS.

AT the Institution of Automobile Engineers recently, Professor John Goodman, of the Leeds University, gave a lecture on the subject of roller and ball bearings. Professor Goodman has been making a consistent study of this question for fifteen years, in the course of which innumerable experiments have been made on various types of both ball and roller bearings under many different conditions of load and at various speeds.

Before dealing with the various criticisms he made, it may be well, says The Engineer, to give one of the most valuable results to which his investigations have led, namely, the establishment of a formula which will give the maximum working load in pounds to be allowed for any given ball bearing. The formula reads:—

$$\frac{K\ m\ d^3}{N\ D + C\ d}$$

where

m = the number of balls in the bearing.
d = diameter of the balls in inches.
N = revolutions per minute.
D = diameter of ball race, diameter being taken from the point of contact of the ball with the race, or for a thrust bearing D = the diameter taken from the centres of the balls.

The constants C and K are as follows:

For Thrust Bearings.

	C.	K.
Flat races	200	500,000
Hollow races	200	from 1,000,000 when the radius of the race is about twice that of the ball to 1,250,000 when the radius of the race is 9-16th that of the ball.

For Journal Bearings.

	C.	K.
Flat races	2000	1,000,000
Hollow races	2000	from 2,000,000 where the radius of the race is about twice that of the ball to 2,500,000 where the radius of the race is about 9-16th that of the ball.

Roller Bearings.

The lecturer dealt first with the question of roller bearings, and commenced by showing Osborne Reynold's diagram illustrating the manner in which the resistance due to friction occurs. The first point he impressed upon his audience was that when an elastic roller rolls on an elastic bed there is always slipping, and his tests show that the amount of slipping depends very largely upon the load, i.e., there is a small amount of slip with a very light load and a comparatively large amount of slip with a heavy load.

In the case of roller bearings, end thrust results in the rollers wearing right through the end of the cage, and, in addition, sets up a vibratory action, which enormously increases the friction of the bearing. A case was mentioned in which this vibration was so large in a particular factory that the bottles on the shelves of the chemical department overhead began to fall over, and the bearings had to be removed. End thrust, it was pointed out, may easily amount to a quarter or a third of the total load on the bearing. With a 10-ton load on a bearing, from 2¼ to 3 tons end pressure would be encountered, and the direction of the end thrust would always reverse when the direction of the rotation of the shaft was reversed. The case was also mentioned of forty or fifty railway wagons fitted with roller bearings which had to be put out of service owing to the amount of end thrust which in some instances had caused the casing to be worn right through.

This end thrust with roller bearings occurs however good the workmanship, although one form of roller bearing was illustrated in which the length of the roller was approximately equivalent to the diameter, and, whether due to this fact or not was not stated, the end thrust was almost absent. Comment was made upon the satisfactory service given by the plain roller bearings used in light railway wagons of the Koppel type, the bearings being practically pieces cut from mild steel rods with the ends rounded. The results obtained with this very cheap form have, curiously enough, been found to be almost equal to those of the most expensive type of roller bearing.

Professor Goodman also investigated the question of whether the efficiency of roller bearings was in any degree affected by the degree of accuracy in the workmanship, but he has come to the conclusion that it is not so, because, after going to the fullest possible trouble to obtain bearings of the highest class, the results obtained were no better than with the cheaper forms. Better results were achieved with long rollers, but these, he said, could not be regarded by any means as an unqualified success.

Summing up end thrust troubles, Professor Goodman said that the friction on the bearings was enormously increased, owing to end thrust. He could give many instances of the seriousness of the wear, and in addition there was the question of rumbling or vibration. With a properly designed roller bearing in which the end thrust was extremely small, the friction was, to all intents and purposes, independent of the lubrication, but when a large amount of end thrust manifested itself, then lubrication made a very considerable difference, for the simple reason that when there was little end thrust a pure rolling action was obtained, whereas with end thrust there was a large amount of friction between the ends of the cage and the flange of the casing. In these instances lubrication did good.

Friction with roller bearings has been determined to be almost independent of the speed, and in all roller bearings, bad and good, the starting effort is very little greater than the running effort, which was admitted to be a point in their favour for machinery constantly starting and stopping. With the worst type of roller bearing the friction was lower than in an ordinary bearing with poor lubrication, but a roller bearing in these conditions was not so good as a bearing running in a bath of oil.

Ball Bearings.

Passing on to the virtues of the ball bearing, the lecturer pointed out that with it there is no end thrust at all, and the friction is very much less than in the majority of roller bearings; hence, there was a good deal to be said in its favor. It might be said against this statement that a ball bearing only bears on a point, whereas the roller bearing bears on a line; hence, a ball bearing of a certain size could not possibly carry so high a load as a roller bearing.

He admitted that there was an element of truth in this, but it was not the whole truth. With equally good material in rollers and balls, and in the absence of end thrust on the roller bearing, the argument would hold rigidly, but since end thrust did come in with the roller bearing, with other troubles in consequence, practically any type of ball bearing was able to carry a much bigger load than any roller bearing.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same, direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division of decimals, will be found a most useful companion study, and should not be overlooked.

Question.—A system of pulley blocks is used to lift a weight of three tons, and if the number of sheaves in the blocks are such that 16 feet of slack is gained for every foot the weight rises, what power will be required if friction be neglected?

Answer.—Three tons is equal to 6,000 pounds; therefore, the pull required will equal $\frac{6000\times1}{16}$ or 375 pounds.

* * *

Question.—A mechanic exerts a pull of fifty pounds at the end of a three-foot spanner, and the nut which he is tightening has a pitch of four threads per inch; if friction be neglected, what stress would he bring to bear on the bolt?

Answer.—Let us suppose a revolution to take place, then the end of the lever in the operator's hand would pass through a space which is the circumference of a circle whose radius is three feet, while the nut would move ¼ inch. The circumference corresponding to 3 feet is 226 inches, therefore, the ratio of motion is 226 to .25=226=904 to 1, and

.25

the stress on the bolt being tightened, would equal 50×904=45,200 pounds.

* * *

Question.—A pressure of 10 pounds acts at one end of a system of levers, and it is found that if motion were to occur, the end where this pressure acts would move through a space 40 times as great as the other end. What pressure would be exerted on the latter?

Answer.—The motions are 40 to 1 and, since the pressures are inversely as the motions, the pressure required would equal $\frac{10\times40}{1}$ or 400 pounds.

* * *

Question.—A balance weight attached to the crank of an engine weighs 4,000 pounds, and the distance where its mass may be supposed to be concentrated is 1½ feet from the centre of the shaft; the revolutions are intended to be 120 per minute, and two is the number of bolts determined upon to secure the balance weight. What should be the size of the bolts if they are of 62,720 pounds tensile strength, and with an assumed factor of safety of 10?

Answer.—The circumference of 1½ feet radius is 9.427 feet; therefore, the circumferential velocity at 120 r.p.m. will be 9.427×120=1,131 ft. per minute, or 18.85 ft. per second. The centrifugal force or tension on the bolts will be $\frac{4{,}000\times18.85^2}{32\times1.5}$ or 29,527 pounds, which is 14,763 pounds to each bolt. As the tensile strength of the bolt material is 62,720 pounds and the factor of safety 10, therefore $\frac{14{,}763\times10}{62{,}720}=2.35$ square inches area at the bottom of thread, equivalent to 2⅛ in. diameter and 4½ threads per inch. The figure 32 used in the calculation is the acceleration due to gravity in feet per second.

* * *

Question.—Express by means of a formula how the dead load at the pitch circle of a gear wheel to transmit the required power is computed.

Answer.—Multiply the horse-power to be transmitted by 33,000 and divide by the velocity of the pitch circle in feet per minute. Example, if the horse-power to be transmitted is 500, and the pitch circle velocity be 2,000 ft. per minute, then $\frac{500\times33000}{2{,}000}=8{,}250$ pounds, or the maximum load at the pitch circle.

* * *

Question.—A feed pump has to discharge 1,925 pounds of water per minute against a pressure of 90 pounds per sq. inch, and the area through the valves is 2 sq. inches; neglecting friction and loss from restricted discharges, etc., what would be the horse-power required?

Answer.—Since the fluid is water, the head corresponding to 90 pounds pressure equals 90×2.31, or 207.9 feet. The discharge per second will be $\frac{1{,}925}{60}$, or say 32 pounds, and since a cubic inch of water weighs .036 pounds, the discharge will equal $\frac{32}{.036}$ or 900 cubic inches per second. Also, since the area through the valves is 2 sq. inches, the velocity will be $\frac{900}{2}$, equal to 450 inches per second, or 37.5 feet per second, and the head necessary will be $\frac{37.5^2}{64}$ or 22 feet. The total head required equals 22×207.9, say, 230 feet, and the horse-power will be $\frac{1925\times230}{33000}$ or 13.4

* * *

Question.—Steam is expanded to 10 pounds absolute pressure, and it is desired to have the feed water at 130 degrees, the temperature of the injection water being 86 degrees, how many pounds of injection water, per pound of steam condensed, will be required?

Answer.—The total head of steam at 10 pounds absolute is 1172.3 thermal units, therefore the ratio required is $\frac{1172\text{-}130}{130\text{-}86}$, or 23.7 to 1. The common allowance for engines with surface condensers is 24 to 30 times the weight of steam condensed, and for engines with jet condensers, from one-third to one-half the cylinder capacity.

* * *

Question.—Why do the driving wheels of a locomotive frequently slip at starting, and how does the application of sand overcome the difficulty?

Answer.—If the tractive force exerted by the locomotive exceeds the frictional resistance at the rails due to the adhesion of the driving wheels, then the wheels will slip. The resistance to slipping varies with the condition of the rails, and is greater when they are dry or wet than when they are merely damp. The application of sand to the rail, of course, increases the friction and enables the driving wheels to obtain a grip. To avoid slipping, the tractive force should not exceed about 22 per cent. of the weight on the coupled wheels.

* * *

Question.—A bucket conveyor driven by an electric motor is used for lifting coal from a railroad car to a hopper 50 feet above the car. If 40,000 pounds of coal are raised per hour, find the horse-power of the motor. Assume the combined efficiency of motor and conveyor to be 60 per cent.

Answer.—$\frac{40000\times50}{60}$ = foot-lbs. of work done per minute. Since the efficiency of motor, etc., is only 60 per cent., the horse-power required will be $\frac{40000\times50\times100}{60\times33000\times60}=16.83$ h.p.

CANADA'S DEBT $303,562,104.

THE national debt of Canada now stands at $303,562,104, an increase of about half a million during December, according to the financial statement issued on January 10. The funded debt payment in Canada is $803,460, and, in London, $267,541,621. There have been considerable increases in both ordinary and capital expenditure, the latter due to large outlays on public works throughout the Dominion.

The revenue during December amounted to $12,931,466, of which seven and one-half millions was derived from customs. The expenditure was a little over nine and one-quarter millions. December's net revenue shows a decrease of a million and a quarter, compared with December, 1912. For the nine months of the present fiscal year the revenue was $127,571,762. This is an increase of three millions over the same period last year, despite the falling-off in customs receipts during the past two months.

Expenditure Increases.

Capital expenditure on public works, including railway and canals, amounted to $3,407,611 during December. Railway subsidies were half a million. This expenditure is about the same as December, 1912. For the nine months of the present year the amount was $40,828,951, an increase of $18,000,000 over the same period last year. The $15,000,000 subsidy to the Canadian Northern accounts for most of this.

In customs revenue there was a net decrease of $391,215, the figures being $82,738,294, as against $84,747,008, but from the latter must be deducted $1,817,499 of Chinese revenue, which is this year included as "miscellaneous" revenue, so that the actual customs receipts for the nine months of 1912 were $82,929,509.

Big Receipts.

In excise revenue there was an increase of half a million in post-office receipts, an increase of $775,000, and in receipts from public works, railways and canals an increase of one and three-quarter millions.

Expenditure on ordinary account for the nine months totalled $75,987,925, an increase of $8,986,350. Capital expenditure shows an increase of $18,158,848, due, as stated, to large outlay on public works and payments of railway subsidies. The total capital expenditure for the nine months was $40,828,951, as against $22,670,103.

NEW CONSTRUCTION ON C.P.R. CURTAILED.

MR. GEORGE BURY, vice-president of the Canadian Pacific Railway, before leaving for Winnipeg last week, after a number of conferences with Sir Thomas Shaughnessy on questions involving western expenditures, which, it was stated, must for 1914 be almost entirely confined for the present to the completion of track-laying, etc., on grades already built, on branch lines, extensions and double-tracking, the latter of which will eventually connect Winnipeg with Vancouver, and on the building of the Rogers Pass tunnel, which will be pushed with vigor. The consideration of expenditures on any new railway construction or other works will come up later in the year.

Mr. Bury said that "Under the direction of Sir Thomas Shaughnessy, C.P.R. expenditures have always been directed in accordance with the actual exigencies of traffic and with the building up of Western Canada, and it was owing to this comprehensive policy that the C.P.R. in 1913 was able to move such a large grain traffic so expeditiously at a time when the great strain of moving the harvest came. The facilities provided in rolling stock were such that car requirements in other directions were able to be met promptly and other traffic moved concurrently with the grain."

PROTECTING BELTS, SHAFTS AND PULLEYS.

THE accompanying instructions have been issued by a Chicago concern relative to the prevention of accidents due to contact with moving belts, shafts and pulleys:—

Belt, rope and cable transmission shall be arranged, so far as possible, to be easily guarded.

Pipe or angle railing placed 18 inches from the pulley or belt shall be provided where there is little danger of anyone getting caught by the belt.

Wire-mesh or perforated-plate casing shall be provided where the location of a belt is such that persons are liable to get caught between the belt and the pulley.

Where the belt is located in such a position that, should it break, flying ends will strike persons passing by the belt, it should be inclosed by a suitable guard.

The full width of a belt should be allowed between two pulleys or a pulley and a hanger on shafting so as to prevent the belt from becoming wedged and possibly pulling down the line shafting.

Belt splicing shall be made so as to eliminate ragged edges or projections which might catch employees' clothing. Endless belts are recommended, especially for high-speed machines.

Belts should be inspected frequently and kept in a condition to avoid accidents. Tight belts should be avoided.

Wherever it is necessary to shift belts, a mechanical device should be provided.

Where it is necessary to unship a belt, a hook or belt-perch should be provided to prevent the belt from resting on the shaft.

Shafting not over 12 inches above floor should be covered.

Shafting over 12 inches and not over 7 feet above floor should be encased or railed off.

Exposed ends of shafting shall be encased or otherwise guarded.

Overhead shafting which must be oiled should be equipped with a walk for the oiler, if practicable.

Electrically driven shafting should be provided with a safety switch, to be used when men are working on it. This switch should be placed at the top of the ladder or in some place where no one will tamper with it.

Shaft couplings should be guarded where safety couplings are not used.

To prevent gears or pulleys from working off the ends of shafting, shaft ends shall project at least the diameter of the shaft beyond the hub of the gear or pulley, so that the key can be locked in place.

Hangers for shafting shall be particularly strong and well secured.

All projecting keys in shafting, when exposed so that a person might get caught thereon, shall be guarded or cut off.

Wherever possible, cotter pins or spring washers should be provided to prevent nuts from working off the ends of bolts.

Setscrews must be guarded, countersunk or placed in safety collar with flanges high enough so that the setscrew head will not project above the flange.

Because of the dangers incident to hoisting material by means of line shafting, it is forbidden that any hoisting be done in this manner. All hoisting shall be done either with hand tackle and block, or with regular hoisting machinery.

Chary About Exhibiting.—The Canadian Associated Press understands that British manufacturers are showing a lukewarm attitude towards the proposed exhibition train to tour Canada. Some firms are convinced their goods could not be adequately advertised under such conditions, but in any circumstances it would have been surprising if the average British firm with inherited conservative instincts, had embraced such a proposal with enthusiasm. It is understood, though, that several firms who hitherto held aloof have been strongly urged by their Canadian agents to associate themselves with the scheme. The exhibition train promoters hope to sell advertising space to the value of $150,000.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

UNIVERSAL TOOL ROOM LATHE.

THE Lodge & Shipley Machine Tool Co., Cincinnati, Ohio, new model universal tool room lathe is made in 16 inches nominal size, but actually swings 18½ inches. To meet the requirements of various users, different types of headstock may be furnished, viz., 4-step and 5-step cone single back geared, 3-step cone double back geared, and "selective head" for single pulley belt or motor drive. As the universal tool room lathe is designed especially for tool room work, it has certain refinements and attachments not required in lathes for manufacturing purposes. The unit system of construction is employed throughout, so that the application or omission of various attachments which can be furnished will in no way affect the other parts. All of these lathes are made to jig and template, and are drilled, planed, and fitted to master plates, so that attachments ordered subsequently can be readily applied by the customer.

Fig. 1 illustrates the 16 in. x 6 ft. "selective head" universal tool room lathe, with full additional equipment, comprising pan, universal taper attachment, universal relieving attachment, translating gears for cutting metric threads in addition to English threads, draw-in chuck with collets, and step chuck with closer. Fig. 2 shows 16 in. x 6 ft. 4-step cone head universal tool room lathe without additional appliances.

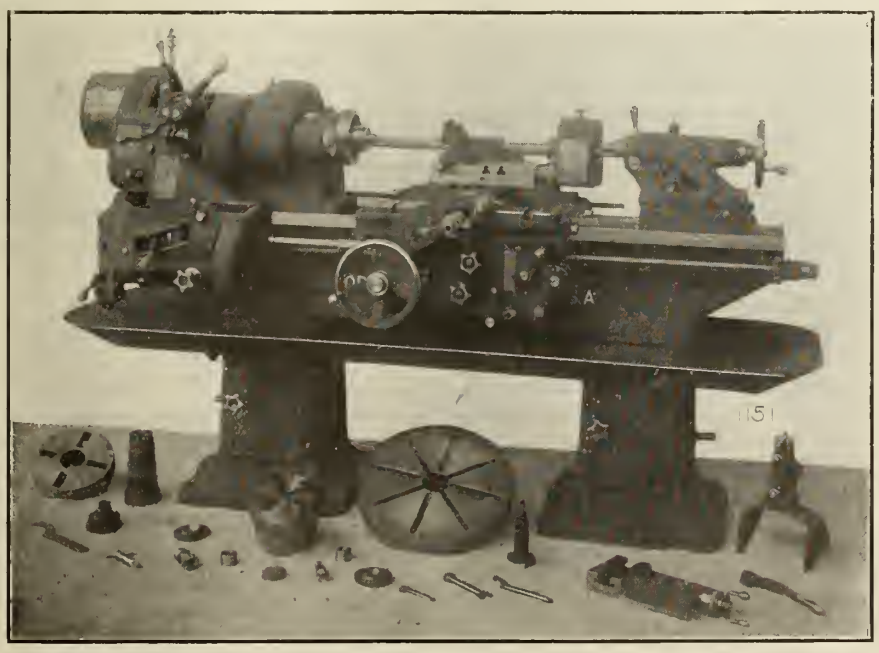


FIG. 1. 16 IN. X 6 FT. SELECTIVE HEAD UNIVERSAL TOOL-ROOM LATHE WITH ATTACHMENTS.

Selective Head.—As the "selective head" was described in Canadian Machinery of July 10, 1913, it is sufficient merely to mention here that when driven by constant speed belt or motor, the "selective head" gives 12 changes of spindle speeds, obtainable through conveniently located shifting levers, and that this head derives its name from the selective type transmission used in the gear box where there are chrome-nickel steel heat-treated gears mounted on chrome-nickel shafts running in ball bearings.

Spindle Nose.—The double nose for the spindle, as formerly described in conjunction with the "selective head," is used in both the selective and the cone head lathes. It provides a pilot for centering the chuck or face plate, and a large diameter of shoulder against which the plate is screwed.

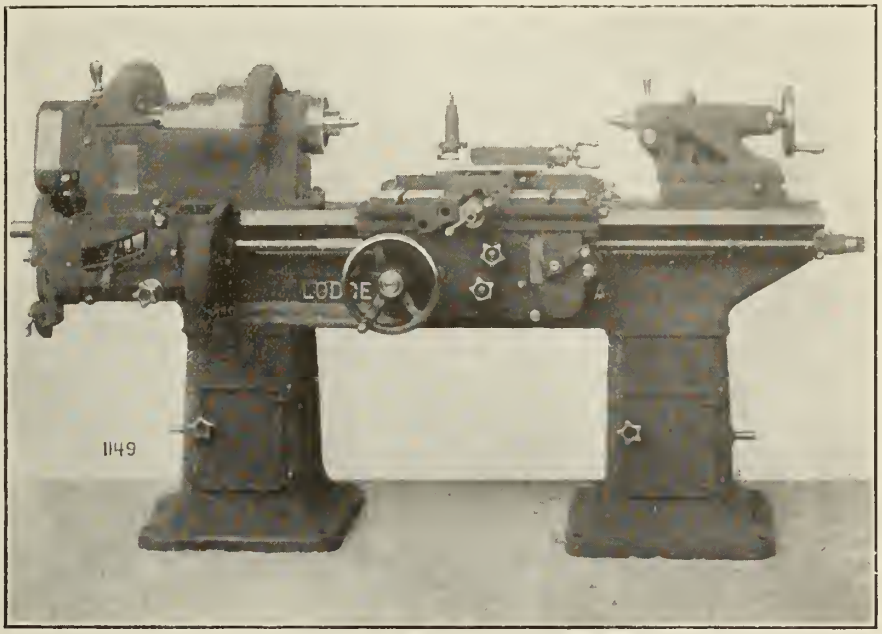

FIG. 2. 16 IN. X 6 FT. FOUR STEP CONE HEAD UNIVERSAL TOOL ROOM LATHE.

Cone Head.—As illustrated in Fig. 2, the main housing of the cone head is carried up slightly above the centre line of the spindle. This makes a very rigid construction and ties the front and rear spindle bearings securely to each other and to the head.

Back Gearing.—In each of the different styles of heads, the back gearing is designed to give uniform progression over the entire range of speeds. On the 3-step cone head, the double back gear is moved lengthwise by means of a lever conveniently located at the top of the headstock cover. In the "selective head" the back gearing is located at the front of the head and the face gear pinion may be withdrawn from mesh. The back gear sleeve and pinion are both cut from a single steel forging.

Spindle Bearing.—The spindle bearings are of special white metal, interchangeable and replaceable, fitted and held into the headstock by screws. These bearings are faced and turned in halves

to exact standard size and the screw holes are drilled to jig. The end thrust of the spindle is taken against the rear housing by alternate hardened steel and bronze washers.

Lubrication.—Oil wells are provided over the spindle and back gear bearings, and a wick oiling system delivers the proper quantity of oil by capillary attraction. All bearings in the quick change gear mechanism and apron are reached by suitable oil tubes.

Tailstock.—The tailstock has a long bearing on the bed, and is designed to allow the compound rest to be set at 90 degrees when using the tool on small diameters. Set over screws are provided, and a hardened scale is secured to the lower side. Plug clamps lock the spindle without throwing it out of line. The spindle is made of tool steel, graduated lengthwise on top for quick reference, and has a long traverse.

Bed.—The bed is of box section, wide and deep, and the legs are set in from the ends. The ways are chilled, which greatly increases the life in alignment. The girders are as wide as the space between them. The six-foot bed has three girders, all of which are of the inverted U type. A planed pad is located directly under the headstock, and this pad receives the quick change gear box, which is tongued and bolted to it. A coarse pitch steel rack is bolted to the bed directly back of the lead screw. The lead screw is placed well up under the front carriage "V."

Carriage.—The carriage, a top view of which is shown in Fig. 3, has an unusually long bearing on the outside shears. It is gibbed at the front, back and inside. The bridge has a supplementary bearing on the inside front shear of the bed for resisting the pressure of the cut and absorbing the vibration from the cutting tool. An oil trough is cast entirely around the carriage, and shear wipers are provided for the bearing surfaces. The cross feed screw has a large self-locking micrometer dial graduated to thousandths of an inch. All carriages are planed and drilled to receive either style of taper attachment, and also to receive the relieving attachment, and no additional fitting is required when applying these parts.

Compound Rest.—The compound rest top slide is provided with large self-locking micrometer dial, graduated to thousandths It is designed so that the extreme width of the swivel rests directly upon the lower slide, thus avoiding overhang of the top slide. The lower slide is graduated on a vertical plane 90 degrees either side of zero.

Apron.—The apron is of the double plate type, and is provided with all steel feed gearing throughout. The hand wheel for imparting hand motion to the apron can be disengaged from the stem while chasing. All shafts have unusually long bearings, and oil receptacles are provided to properly distribute the oil to all bearings. The half nuts interlock with the friction feed mechanism. The apron is tongued and bolted to the carriage, and the pinion engaging the rack on the bed is made of high carbon steel and hardened. The lead screw is set well up under the front carriage "V" to avoid overhang.

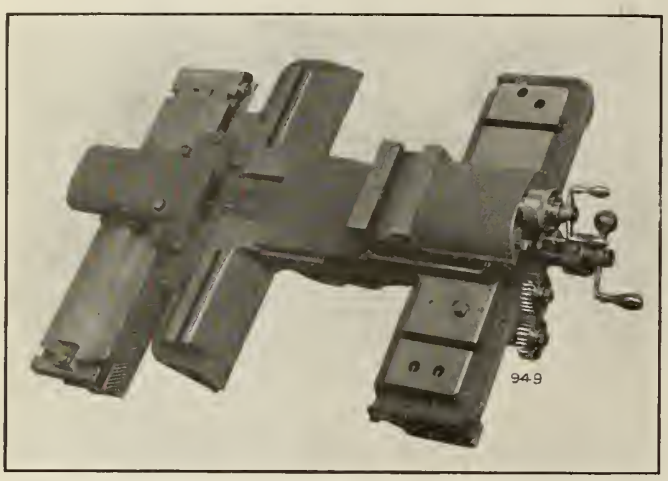

FIG. 3. TOP VIEW OF CARRIAGE WITH UNIVERSAL TAPER ATTACHMENT.

FIG. 4. AUTOMATIC CHASING STOP.

Quick Return.—An entirely new quick return of the carriage for screw cutting is embodied into the design of this machine and incorporated in the apron. The reverse is by friction, and is controlled by the movement of the same lever which opens the half-nuts. By raising the half-nut lever, thus disengaging the half-nuts, the carriage stops. If the lever is raised slightly higher, the quick return mechanism is engaged, and the carriage returns four times as fast as the speed at which the thread is being chased.

Chasing Dial.—A new design of chasing dial is provided, which has a hardened notched disc mounted upon the shaft, which is secured to a worm wheel which engages the lead screw threads. This notched disc has longitudinal movement, and any selected index may be engaged with the stop dog which prevents the half-nuts from becoming engaged until the proper notch in the disc is presented to the dog. This preserves the accuracy of the lead screw on account of preventing the half-nuts from clamping on the tops of the threads, and it is also valuable in that the operator need not watch a dial.

Automatic Chasing Stop.—Fig. 4 illustrates the automatic chasing stop which is attached to the dovetail of the carriage by a clamping screw, and is directly connected to the lower slide of the compound rest. Its function is to form a dead stop for succeeding cuts over the thread. The rate of advancement or depth of cut can be adjusted to thousandths of an inch by knurled screws, and this cut may be varied from .002 in. to .010 in. of depth. The setting of the depth of cut is accomplished by withdrawing the cutting tool from the work. In using this device, the operator need not watch the micrometer dial, but can chase the thread to the proper depth, the rest at all times coming directly against the dead stop. This chasing stop prevents breaking the point of the tool, and with the quick return reduces chasing to a very simple operation.

Quick Change Gears.—The quick change screw cutting and feeding attachment is bolted to a pad on the front of the bed underneath the headstock. This attachment has two shaft centres, one for the lead screw, the other for the cone of steel gears. The sliding tumbler is supported in a slide independent of the shaft bearings, and this slide is arranged close to the handle which moves the sliding tumbler within the slot, thus avoiding overhang of the handle and preventing binding and cramping when setting. Both

shafts of the gear box extend through the left end of the box and the change gear may be applied to either of these shafts. Power is transmitted from the feed gear on the end of the spindle through a reverse plate to the stud in the headstock, then through a quadrant mounted on the end of the gear box which quadrant gives three changes. The gear box itself gives thirty changes, so that, with the quadrant compounding, 90 changes are provided in the regular quick change gear mechanism. The housing carrying the sliding tumbler is locked into position before the intermediate gear can be meshed with the selected gear of the cone. All the shafts are short and the drive is direct. The index is simple and is attached to the top of the box where it can readily be seen by the operator. The machine may be ordered with the plain English threading index, and the Metric attachment can be subsequently supplied without any additional fitting.

Metric Treads.—With metric index it is necessary to make the cone of gears the drivers, whereas in the English index it is necessary to make the cone of gears the driven. When supplying the machine with metric attachment, it is only necessary to add a gear cover, into which are mounted the translating gears. This gear cover is machined and made a duplicate of a plate which is secured to the gear box when the metric compounding gears are not supplied. When the gear box is arranged for metric pitches, it is possible to cut either metric or English by simply turning a knob attached to the bottom of the box. By turning this knob to the left, the metric pitches are obtained, and to the right the English. It is also necessary to place the driving gear at the end of the gear box on the proper shaft; the upper shaft for the English and the lower for the metric.

Plain Taper Attachment.—The taper attachment requires no planed strip on the back of the bed, and therefore a special bed is not required, and the taper attachment can be readily applied to the machine at any time. All carriages are drilled to receive it. The bracket carrying the swivel bar is bolted to travel with the carriage so that at whatever part of the carriage the taper attachment may be, it can be instantly engaged. The taper attachment slide is provided with an extension which may be connected on either side, and this extension engages the arm which clamps it to the bed and holds it stationary when the carriage is feeding. The taper attachment swivel is a steel straight edge. A gibbed shoe slides upon it, which is secured to a slide which confines the cross feed screw to it.

The cross feed screw telescopes through the cross feed pinion on the front side of the carriage, thus the taper attachment may be used with a plain rest or with a relieving attachment, and the depth of cut set by the cross feed screw. The hardened steel straight edge can be set to graduations in inches per foot, and a micrometer adjustment is provided to give extreme accuracy in setting. A nicely graduated steel scale with a compensating pointer gives accurate reading to the swivel bar.

Universal Taper Attachment.—In addition to the parts above described for plain taper attachment, the universal taper attachment has a power traversing mechanism which slides it through its bracket at various rates of travel. Fig. 3 illustrates the universal taper attachment fitted to carriage. A cover plate which protects the taper attachment rack and a cover for the gears on the front of the apron are purposely omitted to give a clearer idea of the construction. The mechanism for giving power traverse to the swivel bar of the universal taper attachment is controlled by a shaft extending through the bridge of the carriage and operated by change gears at the front, driven direct from the apron feed train. Thus, when the universal traversing mechanism is employed, the forces necessary to produce the taper are all contained within the carriage and all side pull is eliminated.

The plain taper attachment is satisfactory for tapers not exceeding 4½ in. per foot, but, on very abrupt tapers, it is of course, impossible to drive the tools against such steep angles, and to accommodate work of this character we have provided the independent driving mechanism to the taper attachment slide. Since the slide may be fed at various speeds, it is capable of turning much longer tapers than with the plain taper attachment. In other words, if the slide feeds one-third as fast as the carriage, the carriage will travel three feet while the slide is travelling one foot, and vice versa. The complete range of the universal taper attachment covers tapers from 1½ in. to the foot and 54 in. long, up to 13¼ in. to the foot and 6 in. long.

Universal Relieving Attachment.—As illustrated in Fig. 5, this device is designed to produce radial, angular, end, or inside reliefs. It is never necessary to go behind the machine to make adjustment. Power is transmitted from the splined shaft at the back of the bed, through the sleeve and change gears, to a shaft below and parallel with the driving shaft. The lower shaft in the housing transmits its power through hardened spiral gears to the cam shaft which takes its bearing in the cross slide. This cam shaft engages a roller mounted in a plunger. The plunger engages a bell crank which is mounted in the top slide of the relieving attachment. The abutting portion of this bell crank is made adjustable by an adjusting screw and, by removing the top cover, this screw may be adjusted for various depths of relief from zero to ⅛ in. movement of slide.

Since the power for operating the relieving slide is supplied directly through the swivel centre, the swivel itself may be set at any angle without affecting the movement of the slide, thus, it is possible to relieve at any angle, inside or outside, or on the face of a piece of work. The cam shaft is placed below the surface of the bridge so that the full swing over the bridge is obtained for relieving.

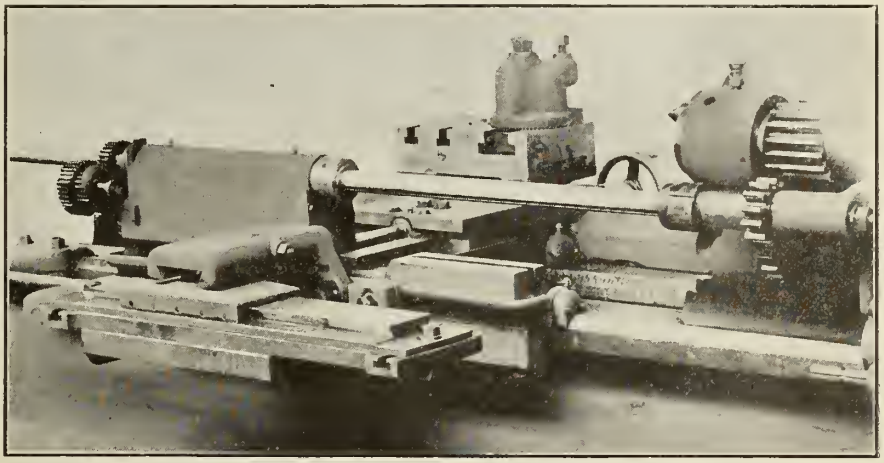

FIG. 5. REAR VIEW OF UNIVERSAL RELIEVING ATTACHMENT.

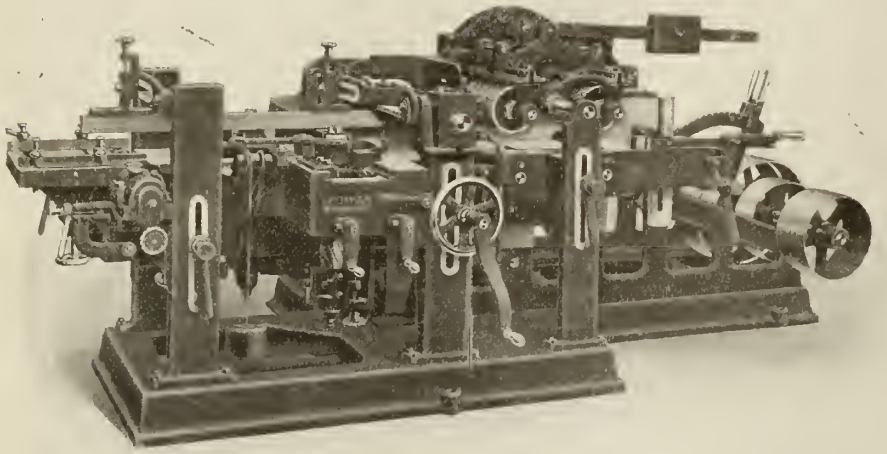


Draw-in Chuck and Collets.—The draw-in chuck is mounted directly on the nose of the spindle, which makes it possible for the draw-in collet to receive stock as large in diameter as the size of the hole through the spindle. Collets may be furnished for diameters from ⅛ in. to 1 5-16 in., both inclusive. The collets are tightened and released by a small key wrench, which makes it unnecessary to hold the driving belt when tightening and releasing the chuck.

Step Chuck.—A step chuck with adjustable jaws and closer is made to apply to the regular draw-in chuck body and is very desirable when a finished piece must be true, also for facing thin pieces of large diameter.

NEW DESIGN MOULDER.

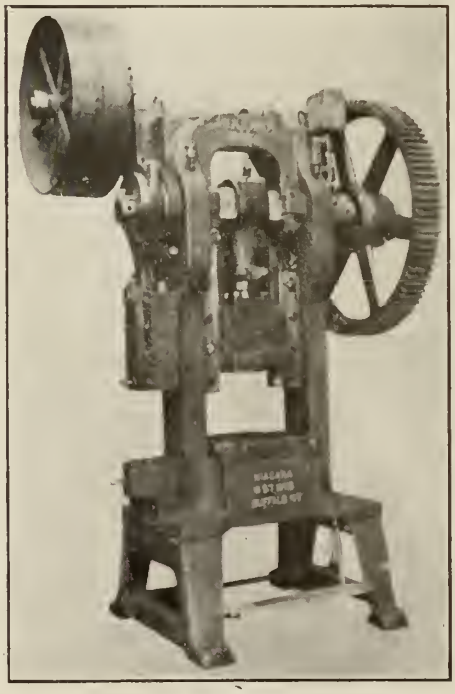
WE illustrate herewith a new design moulder recently put in the market by Cowan & Company, of Galt, Ltd., which has many features that will be of particular interest to woodworkers. The machine is made in two sizes to work 10 in. or 12 in. wide, four sides. The table or bed lowers 8 inches.

Particular attention is drawn to the few gears, and the large diameter of same, with which the machine is equipped. These are all covered, making the machine, as nearly as possible, in this

NEW DESIGN MOULDER.

respect, proof against accident. It is fitted with the Cowan patent compensating gear drive which provides a suitable mechanism between the driving gears and rolls to compensate for any variation of speed that may occur between the different rolls as they rise over the varying thickness of stock. This is particularly serviceable in preventing the locking or binding between the rolls and gears which takes place when thick and thin boards follow each other.

The guide roll on feed end, and the guide spring are held by a new guide spring clamp for which a patent has been applied for. This provides a rapid and secure clamp as well as preventing the burring or marking of the shafts.



Both top and bottom spindles are fitted with self-oiling thrust block to take up end play. This consists of a hard steel collar shrunk on end of spindle, ground accurately to size and running freely between the end of the box and phosphur bronze thrust block equipped with simple take-up device. The whole arrangement is submerged in oil.

Another feature is the outer bearing for upper head which is attached to the post. This is arranged so that should it wear out of line or the bed be set on an uneven floor, by loosening the clamp bolts on the bearing, it will automatically adjust itself to line of the spindle. On setting up the machine, the binding bolts are slackened, which allows the spindle to come to its natural place.

As will be seen by the illustration, the machine is very rigid and substantial and the attachments and adjustments make it suitable for all classes of heavy or light moulding, flooring, shiplap, etc.

NEW DESIGN, HEAVY TRIMMING PRESS.

A NEW design of trimming press has been built by the Niagara Machine & Tool Works, Buffalo, N.Y. It is intended for trimming drop forgings and heavy sheet metal work and for use in the manufacture of hardware, automobile and bicycle parts. This machine differs materially from the general run of trimming presses, which heretofore have been built with the flywheel and pulley adjoining the main gear, and with an outboard bearing to support the overhanging part of the driving shaft. In this new press the flywheel, pulley and backshaft are mounted on top of the machine, and the outboard bearings are entirely eliminated, thus making the machine self-contained. In this way, a minimum amount of floor space is occupied, and the press is accessible from all sides, thus enabling it to be placed as close as possible to the drop hammers, in conjunction with which it is used.

HEAVY TRIMMING PRESS.

The motion of the press is controlled by an automatic jaw clutch, with a gravity releasing device. The inner slide has a dovetail recess to facilitate the mounting of trimming and forming dies. The outer slide receives its motion from an eccentric keyed to the main shaft and a steel pitman, and is used alternately with the inner one. Both the outer slide and the bed have machined recesses so that adjustable holders with cutting-off tools can be attached, if desired.

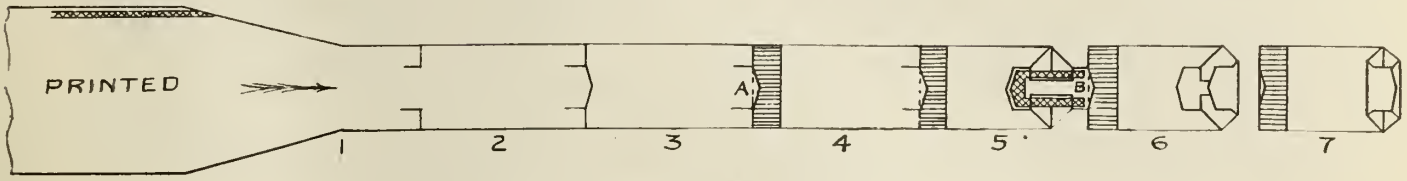
These presses are built in different sizes, with single or double crankshafts, and with either straight or gap housings. The weight varies from 5,000 to 60,000 lb.

PAPER BAG MACHINE.

THE machine herewith illustrated, for the production of heavy paper bags, contains many new features and improvements that combine to make it worthy of attention.

The machines are designed with a view to high production at a minimum of cost for labor and power. They are very compact, requiring but small floor space. The mechanical construction is of a high order, every part being made and finished from materials which ensure long life and efficient service. The machines have a capacity ranging from 20,000 for ¼ barrel bags to 25,000 for 1-16 barrel bags per day of ten hours. The bags are made complete in every detail including printing in one color, the product being ready for marketing by one continuous operation.

Electric stops are provided which automatically control the action of the machine, and instantly stop it if there is a break in the operation. These stops may be set at any desired points to govern the work. A counting and registering clock with bell attachment is provided to count and register the production. The bell rings with every 25 bags made while the clock registers the daily output.



The various operations to produce the bags are as follows: The roll of paper is put on the compression arbor, which holds it in perfect alignment and tension. The paper is then passed through the rotary cylinder printing machine

which prints the continuous sheet with the design or label desired. This is done with electrotypes and the printing for both front and back of bag is done at once. The printed sheet is next run over the drying rolls to quickly dry the ink before entering the machine to be formed into bags.

bag when used. In connection with this pair of rolls, there is a blade and corresponding pocket that indents the paper at (A) Fig. 4, causing the lip to turn up slightly for the next operation of forming the diamond fold or open bottom of the bag as shown in Fig. 5. This is accomplished by means of a

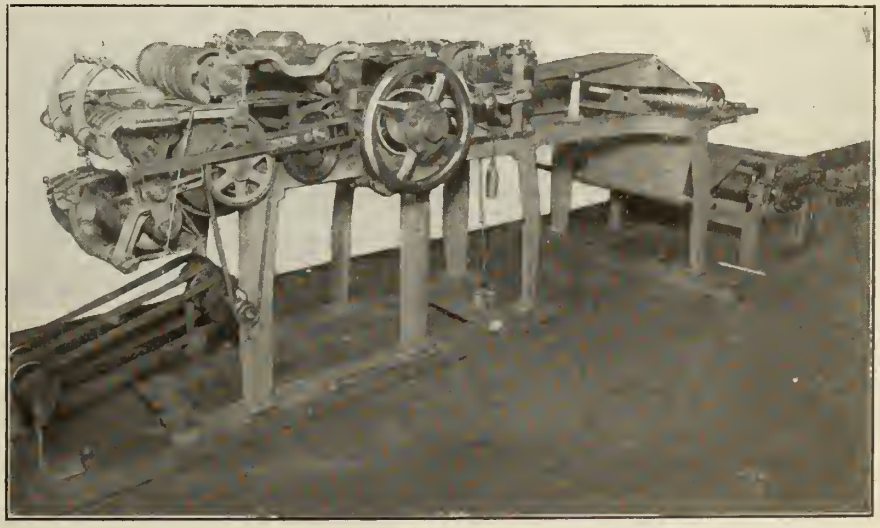
is larger than the others, so that the printing will register evenly throughout the machine and not overlap.

From the inside of this roll, are operated by means of a continuous race cam and levers, a set of projecting fingers to force the paper free from the knives and to throw the flap which forms

PAPER BAG MACHINE—DIAGRAM OF BAGS IN PROCESS OF MANUFACTURE.

The first operation towards forming the bag consists in applying a strip of specially prepared and strong paste to one edge of the sheet which is to form the longitudinal seam on the back of the bag. This is acomplished by means of hard bronze rolls which carry the paste from a receptacle and deposit it on the edge of the sheet; the amount of paste being regulated to exact requirements. At this point, the regulating tension is applied to the sheet which keeps the paper smooth and even throughout the entire operation of forming the bag. The sheet next passes over the tube forming table in such a way that the sheet is formed into a flat tube, Fig. 1, by means of suitable guides, the edges to be pasted together are brought in contact, thus forming a complete and continuous flat tube ready for the further operations which are to quickly transform it into the completed bags.

The flattened tube now passes between a set of rolls that are provided with cutting knives and recesses on both sides. These cut the edges as shown in Fig. 2. This severs the tube except the central portion which serves to carry it through the succeeding operations. To the previously mentioned forming table, there is attached a long steel blade which extends inside the tube through the first pair of rolls to the centre of the second pair. This set of rolls engages the sides of the tube firmly, and carries a finely serrated toothed cutter bar to cut and form the outer flap of the bag bottom. This is accomplished by means of cam operated rolls which by a quick movement from beneath, force the blade inside the tube against the toothed knife above, sever the upper central part of the tube as shown at Fig. 3. This leaves sections of the tube to form the bags being entirely detached except for the central portion on either side or back of bag.



The tubes afterwards pass through a pair of grooved rolls which crimp and soften the short portion which is to form the top of the bag. This is done to facilitate the folding and tieing of the

peculiarly formed device which draws the end of the tube into the desired shape by means of a blade operated by a double beat cam of new design and is drawn under a wide flat blade attached to a tripper bracket. This tripper bracket is operated by an electro-magnet and is a new feature in this class of work. The flat tripper blade enters the tube under the lip (A), Fig. 4, and the flat blade draws the paper into the form shown in Fig. 5.

As the partly formed bag is drawn from the folding device, it passes through a pair of rolls where it receives the paste to hold the bottom when folded. This paste is applied by means of a bronze distributor of roll form which receives its supply of paste from a bronze roll running in a fount and driven by gearing to insure a continuous

the first fold of the bottom, Fig. 6, up into position to be properly engaged by the tucking fingers, and be then forced between the folding rollers which bear against the larger roll. This completes the folding of the first half of the bottom, as in Fig. 6. As the partly folded bottom emerges from the rolls, the former operation is practically repeated by the projecting fingers, and a second set of tucking fingers or blades which fold the last half of the bottom and force it between another set of rolls which compresses the whole bottom firmly together, and makes the paste adhere firmly to the paper. From this operation the bags pass the counter then to the table ready for stacking in piles to dry before bundling for shipping or storage. The complete folded bottom is shown in Fig. 7.

The machines which are clutch driven

PAPER BAG MAKING MACHINE.

supply. The required amount of paste is regulated by wipers and distributed on the bottom as shown by the checked lines in Fig. 5.

The next operation is to sever the bags entirely from each other, which is done by sets of fluted knives contained in the 5th pair of rolls. This is shown at (B), Fig. 5. One of this set of rolls

and require but little power to operate, are built for T. Patterson & Son, 30 Mountain Ave., Hamilton, Ont., by Rae Bros. of Hamilton, Ont., who have made arrangements to build them separately or in sets as required. We understand that Messrs. Patterson contemplate putting the machines on the foreign market in the near future.

INDUSTRIAL NOTABILITIES--No. 17

WHEN people speak of the Nova Scotia Steel & Coal Co. they unconsciously suggest the name of Thomas Cantley, for the names of the general manager and the Steel Company are almost synonymous. To utter the name of Thomas Cantley is to call to mind the words Nova Scotia Steel Co., and vice versa.

He is a bold man. You can see it in his face. His life which follows in detail, proves it. One who can start life in a telegraph office as a messenger boy, run a hardware store, and gradually climb by sheer hard work to the head of a big steel corporation, must be bold. His start in life and his attainments remind one of Andrew Carnegie. The Laird of Skibo began in a telegraph office.

Boldness marked his utterances when the Canadian Manufacturers' Association met in Halifax last September. He grasped the opportunity to tell the men from Ontario that the East, and particularly the steel industry in the East, were not getting a square deal. It is safe to say that Government noted what this bold man said, and are still pondering over it.

Relating briefly how and where he began: He was born in New Glasgow, N.S., in the very town that now contains the immense steel plant of which he is the head. At 15 he was a telegraph messenger, and later an operator. At 16 he became a clerk in a hardware store, and remained in it four years. In 1885 he was appointed sales agent for the Nova Scotia Steel Co., and in 1898 was made assistant manager. To-day he is general manager and second vice-president.

THOMAS CANTLEY.

At various dates between 1895 and 1900, Mr. Cantley spent considerable time in Great Britain and Germany, in connection with the introduction and sale of Wabana iron ore in those countries, months being spent in and about the iron and steel works of the Westphalian District and the Silesian and other Northern Districts of Germany, with the result that this company, since that date has exported to and sold Germany more than two million tons of Wabana ore.

In 1899, Mr. Cantley was commissioned by his directors to proceed to London and open negotiations with the General Mining Association for the purchase of the famous "Old Sydney" coal deposits of Cape Breton. The following winter he was cruising the Mediterranean coal-receiving ports, Marseilles, Genoa, Naples, and the ports in the Adriatic, investigating the methods of discharge, storage, sale and consumption of bituminous coals in those ports, and the feasibility of supplying Southern Europe with bituminous coal in competition with British and American mines.

In 1909, 1910 and 1911 several visits were made to the United Kingdom, Germany and France, for the purpose of investigating at first hand, coal and ore mining and handling in the native mines of these countries, and studying first-hand the open-hearth making, including the investigating of the subject of fluid compression and the hydraulic forging of steel. The outcome of this was the installation of the works of the company at Sydney Mines of the first fluid steel compression plant in Canada, followed by the installation at New Glasgow of one of the most modern hydraulic forging plants in existence.

Mr. Cantley married Maria Fraser, Pictou, N.S., in 1883, and had three sons and two daughters, four of whom are still living. He is a member of the Iron and Steel Institute of Great Britain; of the American Institute of Mining Engineers; the West of Scotland Iron and Steel Institute, and the Electro-chemical Society; the Canadian Mining Institute, and the Nova Scotia Mining Society, also a member of the Halifax Club, Halifax, and the Scotia Club, New Glasgow. He is a Presbyterian, and a Conservative, and resides in the town where he was born—New Glasgow.

ROTARY ENGINES.

WE had thought that the development of the steam turbine into the front rank of prime movers—eall it a rotary engine if you like, would have had a somewhat dampening effect on inventive genius relative to what are distinctively known as rotary engines; in other words, the revolving piston type machine. There has, however, been little let-up, which goes to show what a fascination sueh a product seems to have for some people.

Like men and machines of a class generally, there is a striking similarity between all the piston type rotaries. Valuable time and hundreds of thousands of dollars have been expended in the quest for a piston type machine which will compass the work of the old-time, yet modernly designed reciprocating steam engine; and now that a rotary type machine —the steam turbine, has given evidenee of its capacity, efficieney, economy, and reliability under the most severe and exacting service conditions, in spite of its eomplicated strueture, and that the best brains of the eivilized world in steam and mechanical engineering have failed to connect greater simplicity with reliable service, it only remains for those obsessed by the idea that they have a piston type rotary engine design in their head, which if put into material form would revolutionize the whole realm of prime movers, to lull it to sleep and tuek it away against a day when their work and worth will be less valuable to the engineering profession than it is now.

PROFIT-SHARING.

THE profit-sharing scheme announced by the Ford Motor Co., of Detroit, easily takes first place in the industrial records of the New Year, and may, on aecount of its uniqueness and prodigality, maintain pride of place for some considerable time to come. Taking all the circumstances into consideration, there is little prospect of a parallel to the scheme being found in any page of history relative to industrial enterprise.

In brief, $20,000,000 profits are reckoned as being assured for this present year, and of this amount, one half, or $10,000,000 is to be distributed among Ford employees. The plant will run throughout the full 24-hour day, on three operative shifts of 8 hours each, and all men over 22 years of age in the Company's employ will receive a minimum wage of $5.00 per shift of 8 hours, while those worth more will receive additional remuneration, according as their services warrant.

What will be the general impression formed of the scheme as launched and what will be the general effects, beneficial or otherwise, are matters that the lapse of a greater or lesser period of time ean only determine, but meanwhile the opinion may be hazarded that employers generally, for good and sufficient reasons, will not be disposed to follow suit, even on a much reduced scale, and that employees engaged in a myriad trades and callings will be thrown into a state of unrest, which will take Father Time some traveling to soothe.

The Ford Company is largely in a elass by itself, its plants being models of up-to-dateness in layout, equipment and system, whereby a high quality and world-popular product is manufactured on the most economical basis. As a result, enormous profits are being made, and what is perhaps the most impressive feature in connection with these profits is the fact that their accumulation is due to a moderate return per unit on a large output.

The desire expressed by the President, Mr. Henry Ford, that "other employers will recognize the unequal distribution of earnings and endeavor in their own way to make a better division" is a laudable one, yet, while there may be room in many cases where such action might be taken, and given publicity to, there is the inevitable outcome that large numbers of high principled employers, whose business success is nothing beyond a living for all in it, relatively, would be placed in a most undesirable position, not only in the eyes of their manufacturing associates, but in the good-will and esteem of their own and other firms' employees.

The Ford scheme when considered from the "high cost of living" viewpoint, pits steel against steel, and may not on this account meet with the approval of those whose desire is the lowering of the cost of the product, but whatever our views, the marvelous success of the Ford Company, and the boldness and extent of their 1914 workers' welfare propaganda must merit our admiration.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Jan. 12, 1914.—There is little to report this week, conditions remaining practically unchanged. A leading machinery house states that there will be a great rush of business as soon as money becomes a little easier. Many firms would be in the market for machinery now but for the lack of funds.

The Montreal Locomotive Works, Ltd., although they had a good year in 1913, when they built 318 locomotives, are very quiet at present. They have only two orders on hand, and have been compelled to reduce their staff to 760 men, whereas they employ about 2,000 men when business is brisk. However,, rumor states that it is not improbable that this firm may shortly secure a very large order from the Canadian Northern Railway, who are also understood to be again in the market for a large number of freight cars.

The Canadian Car and Foundry Company's plants at Turcot and Dominion were closed down from December 24 till January 5; and, although both shops are now open, it is understood that they are only operating at about 50 per cent. capacity, except in the passenger car department. The company has on its books orders amounting to $3,500,000, but new orders are coming in very slowly. This refers more particularly to the freight car shops. The passenger car department is said to have enough work on hand to keep it busy till October next.

Although Montreal's water supply is once more normal in quantity, public opinion is still strongly exercised over the recent water famine. Work is being rushed on the installation of an emergency intake pipe connecting the pumping station with the Lachine Canal. The pipe will be 1,200 feet long by 6 feet diameter, and will only be used in an emergency, since the water drawn from the canal would naturally not be all that could be desired from a hygienic point of view. This new intake pipe is expected to cost about $50,000.

Metals.

The metal market remains dull, but prices show a slightly firmer tendency. In the steel trade it is likely that an improvement may be looked for in the immediate future, a rise in prices being probable in sympathy with the United States market. Reports to hand to-day from Pittsburg state that more than 50,000 men, who have been idle for from one to three months, will be re-employed by the end of this week in the Pittsburg district alone, where steel orders aggregating 125,000 tons are said to have been entered.

Toronto, Ont., Jan. 13, 1914.—Enquiries for steel for the first of the year are good. There is more confidence being shown, and before long orders should come in freely. There is a slight buying movement not noticed before, and the market is considerably stronger. Prices remain practically the same as last week.

For nuts, bolts, and screws, the demand is fair. Stocks carried by both the retailer and jobber are bare, and the minute the public gets confident, there will be a big demand. Prices remain constant. It is believed that these are as low as they can go. If there is any change it will be upward.

We quote plate washers this week. The discount—45 per cent. off—has gone up since November. The prices of nuts and bolts have not been affected much. The bolt business took a spurt forward two weeks ago, but taking of stock everywhere at Christmas caused it to slacken up again. Bolt and nut manufacturers are piling up stocks in the hope that a big demand will come from the West in March.

In the city, several engineering firms have recently received large contracts which will keep them running during the winter. The Massey-Harris Co. are very busy just now, much of their business coming from export orders. Implement firms in Hamilton are also increasing their staffs as winter progresses.

Factory Products, Ltd., who have two sides to their business—electrical supplies and steel—report a record year, and at present are not noticing the depression. Their business in electrical supplies for December, 1913, was over 40% in excess of that done in 1912.

Machine tools.

Enquiries for machine tools are fairly good considering the condition of trade. The only feature this week is the specification issued by the Electric Steel & Metals, Ltd., Welland, Ont., who have commenced the erection of one section of their plant. The Hull Iron Works, the new name of Coplan's, who moved their plant from Ottawa to Hull, Que., have purchased a full line of machine tools, valued at from $6,000 to $7,000. They also purchased considerable foundry equipment and electric motors.

There has been a radical change in machine tool agencies throughout Canada during the past few weeks.

The metal market is still asleep. Tin is a cent a lb. cheaper.

St. John, N.B., Jan. 9, 1914.—The improvement of conditions in financial circles is making its effect felt in St. John as well as elsewhere, and the result is shown in the announcement of new enterprises of more than local interest. In addition to announcements concerning plants such as the Ford Automobile Co., the Canada Wire and Nail Co., and others having established themselves in this city, come now new reports in which it is stated that another automobile concern will establish itself in St. John, as also a packing Company. The automobile Company referred to is the Dominion Motor ar Co., Ltd., which is to be capitalized at $400,000 in common and preferred accumulative 7 per cent. stock, $300,000 of which has already been paid up. John A. Graham, former general manager of the Maritime Motor Car Co., Ltd., which was absorbed recently by the Ford Motor Car Co. will be general manager of the new concern. with Leslie F. Bond

sales-manager and vice-president. The board of directors will not be chosen until a meeting is held, but it is fully expected that the president will be H. M. Kilburn, of the National Bank, New York City, with a board of directors comprising P. A. Rockefeller, J. H. Flagler and other well known American capitalists, two of them being prominent directors of an American automobile company capitalized at $10,000,000. Preliminary application for a charter has been made by S. M. Skinner of this city.

The company has leased from the Coldbrook Realty Co., a site adjacent to the Ford plant and, in the factory to be established, will construct a light six-cylinder 40-50 h.p. touring car from parts imported direct from England. It is later intended to manufacture the parts at Coldbrook where the site is located. Construction is to start within sixty days, and the plant is fully expected to be ready to begin operations by July 1. Mr. Graham, who will be general manager, said this week that this really meant the start of the introduction of American capital into Canada in larger amounts than heretofore for the promotion of industrial enterprise.

The New Brunswick Packing Co., recently organized, is now closing negotiations for a site in this city to establish a modern large sized meat packing plant. Stock will be raised in the Province for supply purposes. The St. John Desk Co., which has a factory there, has found it necessary to enlarge its plant, and is preparing to erect a new and up-to-date wood-working factory at Coldbrook to cope with its growing trade.

Leslie F. Bond, referred to in a foregoing paragraph in connection with the new automobile industry is planning the establishment of a plant for the manufacture of brick and crushed stone. Brick at the present time is being imported from Nova Scotia at a cost thought higher than necessary, because of the local yards being filled with orders. It is believed that abundance of material for the manufacture of bricks is to be had in the city, and a sample of clay will be sent next week to the C. W. Raymony Co., of Dayton, Ohio, to determine whether or not this is the case. If it be found satisfactory, the Raymony Co. will very likely locate in St. John adding another plant to their lengthy chain.

TRANSMISSION MACHINERY CONTRACT.

THE Chapman Double Ball Bearing Co., have recently secured the contract for the complete transmission equipment, including their ball bearing hangers, for the new Michigan Central Railway Shops at St. Thomas, Ont. This Chapman company has previously equipped the Grand Trunk Railway Co. shops at Stratford, the National Transcontinental Railway shops at Transcona, the Canadian Pacific Railway at West Toronto, North Bay, McAdam Junction and a section of the Angus shops, and the Intercolonial Railway shops at Moncton, N.B. and Riviere du Loup, Que.

Personal

A. E. Jenckes, head of the Jenckes Machine Co., St. Catharines, Ont., was elected an alderman at the recent municipal elections.

Elijah Eagle, foreman of one of the departments of the Preston Car & Coach Co., has resigned, and has gone into the lumber business at Cochrane.

Sir Sandford Fleming, the eminent Canadian scientist and engineer, celebrated his 88th birthday at Ottawa, on Wednesday, Jan. 7. He is enjoying good health.

Edward Lee, of the rail inspection staff of the Dominion Iron & Steel Co., Sydney, N.S., has gone to England for a trip, after which he will move to Pittsburg.

George P. Napier, C.E., has been appointed assistant engineer in the British Columbia Department of Public Works, to J. E. Griffith, Chief Engineer and Deputy Minister of the Department.

C. C. Cariss, chief draughtsman for the Leonard Engine Works, London, Ont., has been appointed instructor in mechanical drawing and shop mathematics for evening classes, at Ingersoll, Ont.

Charles D. Campbell, B.A., Sc., town engineer of Galt, Ont., and son of D. M. Campbell, manager of the Preston Car & Coach Co., was married to Miss Eve May Pickard, of Galt, last Thursday.

G. B. Green, general manager of the General Supply Co., Ltd., Ottawa, and C. R. Medland, manager of the Winnipeg branch, were in Toronto last week conferring with G. B. Harlock relative to business for 1914.

J. Frater Taylor, president of the Lake Superior Corporation, leaves early in February for the Old Country to have a conference with the corporation's financiers. On his return it is expected that work on additions to the plant will commence.

V. L. Upson, one of the promoters of the Dunville, Wellandport and Beamsville Electric Railway, has taken the position of general manager of the Buffalo and Jamestown Electric Railway. He says the D.W. and B. Railway will undoubtedly be built this year.

J. F. H. Wyse, consulting engineer, 34 Victoria Street, Toronto, has been appointed organizer and engineer of the Ontario Safety League. He has, for a number of years, been associated with the Ontario Railway and Municipal Board in a consulting capacity.

Charles F. Roland, Industrial Commissioner for Winnipeg, has returned from a visit to Great Britain, where he arranged for the financing of ten buildings for manufacturers. He has also arranged for a visit to this country of a number of prominent British business men.

William St. Clair, manager of the St. Clair Bros.' foundry, Galt, Ont., was presented with an engraved gold-headed umbrella on Friday, Jan. 2 by the employes. William Davies on behalf of his fellowworkmen read an address in which he referred to the good feeling existing between the manager and men. William Vrooman made the presentation.

John R. Freeman, who has been engaged as an expert to inquire into the water situation in Montreal, was born in 1855, and received his early training as an engineer with the Essex Company of Lawrence, Mass., of which the late Chas. J. Storrow, one of the earliest and most able of hydraulic engineers in America, was the executive head. After acting as consulting engineer to various manufacturing companies, Mr. Freeman opened an office in Boston.

A. M. Moseley, manager of the Page-Hersey pipe mills, Welland, was the guest at a banquet at the Welland Club on Saturday, January 3, prior to his departure for Fort William to take charge of the firm's new plant there. W. W. Near, president, was in the chair, and others present included: I. V. Mansel, assistant to the president; Jos. Moseley, manager of the Guelph plant; H. F. Lloyd, general manager of sales; H. Rook, secretary-treasurer, and Geo. Sauber, chief salesman. Mr. Moseley was presented with a club bag, bearing his initials. Several tributes were paid him by those present. Earlier in the day H. J. Foster, chief electrician, on behalf of the employees, presented the departing manager with a diamond ring. Mr. Moseley has been entrusted with the starting up of all the company's plants—at Guelph, Welland, and now of that at Fort William.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.: Municipal Undertakings; Mining News.

Engineering

St. John, N.B.—T. McAvity & Sons, Ltd., are preparing to call plans for the erection of their new plant.

Greenwood, B.C.—In a fire last week at the B. C. Copper Co.'s plant a 40 h.p. motor and a small crusher were destroyed.

Ottawa, Ont.—It is reported that the plant of the International Marine Signal Co. closed down indefinitely on January 5.

Wingham, Ont.—The Western Foundry Co., which closed down before Christmas, does not expect to start again for some weeks.

Toronto, Ont.—The Canada Foundry Co., who were reported to have closed down indefinitely, state that work will be resumed after stocktaking.

Cobourg, Ont.—The Car Works have re-opened, after being closed down for some time. Orders for cars which will keep the plant in operation for several months have been secured.

Dundas, Ont.—A fire in the storehouse and machine shop of the Canada Crushed Stone Co. on January 10 did damage amounting to about $20,000. The loss is pretty well covered by insurance.

Niagara Falls, Ont.—The Canadian Kennedy Mfg. and Engineering Co. was this week incorporated at Toronto, capital $400,000, to manufacture rock and ore crushers, mining and cement-making machinery, conveying apparatus, boilers, engines, mills, tools, hardware accessories and equipment, etc. Incorporators: Charles Hurphy, Harold Fisher, etc., Ottawa.

Victoriaville, Que.—The Begin Manufacturing Co., Ltd., recently incorporated with $49,000 capital, will establish an iron foundry here. G. Begin, of Windsor Mills, Que., is one of the incorporators.

Toronto, Ont.—The King street works of the Gurney Foundry Co., makers of stoves, which have been closed down for several weeks, resumed operations on Monday last. The plant at Toronto Junction has been running full time.

Derby Line, Que.— The Union Twist Drill Co., Derby Line, Vt., are preparing plans for the erection of a factory in the Quebec portion of the town of Derby Line. Frost & Chamberlain, Worcester, Mass., are their architects.

Sherbrooke, Que.—Mackinnon, Holmes Co., Ltd., bridge builders, have asked the city to guarantee their bonds to the extent of $40,000 to enable them to build a plant. The chairman of the Finance Committee opposes it.

Edmonton, Alta.—M. C. Murray, field superintendent of the Nakamun Oil and Asphalt Co. will establish a plant here for the manufacture of oil machinery. The only other plant in Canada is at Petrolea, Ont.

Hamilton, Ont.—The Willys-Overland Automobile Co., a United States firm with headquarters at Toledo, Ohio, are incorporating in Canada with a capital of $500,000, and will begin active operations to manufacture automobiles at Hamilton.

Woodstock, Ont.—The ratepayers have agreed to lend $20,000 to the Woodstock Wind Motor Co., Ltd., for the consolidation of this plant with the Mitchell Concrete Machine Co., Toronto; the main plant to be built in Woodstock. Isaac L. Mitchell, owner; Thomas Watson, manager, Woodstock.

Bradford, Ont.—Watson, Limited, Toronto, makers of wire screening, etc., have built a plant here, and are now moving the old machinery in. No new machinery has been purchased yet. Operations on present lines are to be extended. The Company was known in Toronto as the Watson-Smith Co.

Toronto, Ont. — Sir William Mackenzie, president of the C.N.R., on his return from a trip over his transcontinental line last week, announced that the shops to be erected at Leaside, near Toronto, will be the largest on the system. The company will spend $10,000,000 on rolling stock, much of which has already been ordered in Ontario.

Deseronto, Ont.—After putting their new blast furnace at Parry Sound in operation last September, the Standard Iron Co., Ltd., makers of charcoal pig iron, reconstructed the Deseronto fur-

EQUIPMENT REQUIREMENTS

The Electric Steel & Metals Co., Welland, Ont., will be in the market during the next 30 or 60 days, for new or second-hand Machines as follows:—

1 Grinding Mill, 7 ft. dia. overdriven; ⅛-inch perforated plates; output about 3 tons per hour.

1 24 inch double grinder, with one wheel 24 inches x 3 inches and other 24 inch x 1½ inches; for dry grinding.

2 18 inch Single Grinders, 18 inches x 2½ inches wheel; for dry grinding.

1 Double Spindle Grinder, fitted with two emery rollers, 2 inches dia. x 6 inches long.

2 4-ft. Smiths Hearths.

1 Fan for Smiths Hearths, Belt Driven.

1 Belt Driven 160 lb. Hammer, 18 in. stroke; forge up to 6 inches.

1 Slotting Machine 8 inches stroke, to admit about 42 inches dia. and 13½ inches depth; traverse of table about 18 inches x 15 inches.

1 Radial Drilling Machine, about 4 ft. 6 inches arm; 2½ inches spindle; 14 feet feed; 12 inches raise and lower of arm; bed, 6 feet x 3 feet x 2 feet 3 inches.

1 Pillar Drilling Machine to admit about 30 inches dia. 2¼ inches spindle; 9 inches feed; 22 inches dia. table.

1 Saw Sharpening Machine, to sharpen saws from 6 inches to 36 inches dia. Belt Driven.

2 Hack Saw Machines, belt driven, to cut 8 inches x 8 inches; 18 inch blade.

1 Tool Grinder with one dry stone 12 inches x 1½ inches and one wet stone 12 inches x 1 inch; on stand.

Woodworking Machinery.

1 Planing machine with countershaft to take up to 15 inches wide, and 1-16 inch to 9 inches thick.

1 Circular Saw about 30 inches dia. 4 feet 4 inches x 2 feet 3 inches table, rising and falling.

1 Boring machine, for boring up to 7 inches deep.

1 Hand mortising machine, taking timber up to 16 inches x 7 inches.

1 Trimming machine, 8 inch stroke, taking up to 4¾ inch thick, table 20 inch x 8 inch.

nace, which is now in operation, at a cost of $60,000. The stack has been rebuilt and enlarged, increasing its daily capacity to 125 tons of pig iron; new stoves have been installed, and minor improvements made.

Toronto, Ont.—Canadian Copper and Armour Plate Co., Ltd., were recently incorporated at Toronto, with capital of $1,000,000, to carry on the business of foundrymen and metal manufacturers; to manufacture, treat and smelt ores and metals of all kinds; to manufacture and deal in articles, tools, machinery, and articles, the manufacture of which involves the use of copper, aluminum, or other metals. Incorporators: James F. Uffen, Emma Sandusky, etc., Toronto.

Victoria, B.C.— Yarrow & Co., Glasgow, shipbuilders, who have purchased the shipyards of the B.C. Marine Railway Co. at Esquimalt, including a slip capable of docking vessels up to 300 feet, etc., announce that they will build additions as business increases. At present repairs to vessels and machinery will be undertaken. Mr. Keay, of the Glasgow plant, will reside here for three years, after which Mr. Norman Yarrow and Mr. Izard will take charge. The Government dry dock will be built at Lang Cove, which is quite near.

Gananoque, Ont. — The Gananoque Spring & Axle Co., Ltd., one of the branches of the Ontario Steel Products Co., a merger of several spring and axle companies in Ontario, started up their new plant here last week, built to replace that destroyed by fire in October. The plant is much larger than the old one, and was built by Anglins, Ltd., in a little over two months. The steel work used in the new building was furnished by the United States Steel Products Co., and fabricated by the International Marine Signal Co., of Ottawa.

Sydney, N.S.—With reference to the new heating furnace being installed in their rolling mill by the Dominion Iron & Steel Co., we are advised that this is an ordinary inclined furnace for heating steel ingots, no special machinery being needed in connection with its installation, nor will it be used for treatment of any new kind of steel. In the ordinary course of operations a certain number of ingots have to be set aside, and hitherto these have been reheated in the soaking pits in connection with the blooming mills. As the company's production of steel has considerably increased, it has been found inconvenient to continue this practice, and the new furnace has been installed to take care of the cold ingots, and relieve the soaking pits of this tonnage.

Electrical

Paris, Ont.—Hydro-Electric power was turned on in Paris for the first time on Jan. 8.

Neepawa, Sask.—The ratepayers recently voted $18,000 for the erection of an electric power plant.

Brantford, Ont.—Hydro-Electric power will be utilized for pumping the water at the local waterworks plant.

Coaticook, Que.—The town will spend about $1,500 on a line to Dixville for supplying power and light.

Brantford, Ont.—Hydro-electric power will be turned on for street lighting and domestic lighting on February 1.

Stouffville, Ont.—The town will purchase and improve the electric light plant. The latter will cost $5,000, and $2,000 will be spent on improvements.

Banff, Alta.—The Government will spend $100,000 on the establishment of a hydro-electric plant, the power to be generated at Minniewanka Lake.

Ottawa, Ont.—The Minister of Railways has approved the plan of the Cedar Rapids Power Company for its proposed transmission line from the Rapids to Cornwall.

Hamilton, Ont. — W. C. Hawkins, managing director of the Dominion Power and Transmission Co., believes construction work on the new steam power plant will commence in March.

Guelph, Ont.—A Company composed of local men has been formed for the manufacture of tungsten lamps. A plant with an output of 1,000 lamps per day will be built. Ald. J. E. Carter is a director.

St. Catharines, Ont.—The Niagara, St. Catharones and Toronto Railway is erecting a power house on Welland Ave., 40 x 35 feet, costing $45,000. The Canadian General Electric Co. is supplying the equipment.

Winnipeg, Man.—Permission to the Winnipeg civic light and power department to do a light and power business in the municipality of Rockwood was granted by the Rockwood Council at its last regular meeting.

Vancouver, B.C.—The Daily Reduction Co., of Hedley, B.C., has accepted the plans drawn by A. J. Matheson of Cartwright, Matheson & Co., of this city for a power dam across the Similkameen river at Hedley. The dam, which will be over 200 feet long, will develop a horse power capacity of 18,000.

Brandon, Man.—A transmission line from Winnipeg to Brandon and Portage la Prairie could be built it is estimated for $500,000. These two towns contemplate taking power from Winnipeg. A committee has been appointed to secure data.

Yarmouth, N.S.—The special committee recommends that a contract be given to the Northern Electric & Mfg. Co., of Montreal, for apparatus, etc., for a 3 circuit system, compressed air plant, 60 cycle, 3-phase, 220 volt circuit air compressors, motors, etc., at $2,000; battery switchboard, etc., at $1,587; wire, labor, etc., at $425.

London, Ont.—The remaining equipment necessary for the furnishing of hydro power to operate the street railway system has been shipped from Montreal, and will be completely installed by the end of February. The Company is using only part hydro at the present time, but after March 1 will be using it exclusively.

Quebec, Que.—The Provincial Waterways Commission, of which the Hon. S. N. Parent is president, has completed its report. It is understood that the Commission favors the harnessing of the St. Maurice River in the vicinity of Le Tuque by the building of a dam, which will make possible the development of 500,000 horse-power for industrial purposes.

Calgary, Alta.—The Eau Claire & Bow River Lumber Co., First Avenue, W., are reported to be considering a plan for developing power to the extent of 1,500 k.w. The cost of the development will be about $300,000, and will probably involve the installation of two gas driven units and two turbo-generators. It is proposed to start work upon this development in the spring of 1914.

Berlin, Ont.—Several rural districts in North Waterloo have made a request to the Hydro-Electric Commission for information as to the cost of obtaining hydro power. They were quoted as follows:—For St. Jacobs, 50 horse-power would cost $29.04; for Conestogo, 50 horse-power would cost $36.59; for St. Clements, 50 horse-power would cost $42.68; for Floradale, 40 horse-power would cost $51.57. All the points named will, if taken, be served by the Berlin-Elmira hydro line.

Refrigeration

Victoria, B.C.— The Swift Canadian Co. have completed a new $200,000 branch here. The refrigerating machinery, of 35 tons capacity, was installed by Huetteman & Cramer, Detroit.

Building Notes

Winnipeg, Man.—The Masonic Temple Association of Winnipeg will erect a new building at a cost of $250,000. The site is on Furby street.

Calgary, Alta.—R. B. Bennett, M.P., states that Government engineers have been in the city selecting a site for a $1,500,000 elevator. A million dollar post office and an armory will also be built.

Toronto, Ont.—R. C. Bustard has purchased a lot on the east side of Yonge Street, south of Isabella Street, and adjoining Doan's livery, 35 x 90, for $50,000. Mr. Bustard will erect a modern steel building on the property.

New Incorporations

The Star & Hydro-Electric Co., Ltd., has been incorporated with a capital of $399,000, with head office at Montreal, to carry on business as electricians and manufacturers.

The Eureka Fence Brace Co., Ltd., incorporated at Toronto, capital $20,000, to manufacture fence braces, steel and iron fence posts, etc., at Essex, Ont. Incorporators: William Church, Hugh F. Wigle, etc., Essex.

The Gardner Basket Co., Ltd., incorporated at Toronto, capital $45,000, to manufacture boxes, baskets, etc., at St. Catharines, Ont. Incorporators: Robert Thompson, Charles E. Secord, etc., Grantham, Ont.

Hamilton Molybdenum Alloys Co., Ltd., incorporated at Toronto, capital $500,000, to work mines, to dig for, raise, crush, wash, smelt, assay, analyze, etc., at Hamilton. Incorporators: Wm. A. Sweet, James Harris, etc., Hamilton, Ont.

A.B. See Electric Elevator Co. of Canada, Ltd., incorporated at Ottawa, capital $100,000, to manufacture elevators and all kinds of hoisting machinery, at Montreal, Que. Incorporators: Louis A. David, Louis E. A. D'Argy-Mailhiot, etc., Montreal.

The Hilton Electric Co., Ltd., incorporated at Ottawa, capital $50,000, to carry on the business of electric engineers and contractors, and as dealers in and manufacturers of machinery, tools, etc., at Montreal, Que. Incorporators: Wallace R. Hilton, Aaron Issenman, etc., Montreal.

Anchor Cap and Closure Corporation of Canada, Ltd., incorporated at Toronto, capital $50,000, to manufacture all kinds of articles and devices for enclosing the contents of any and all kinds of receptacles, and all kinds of machinery, at Toronto. Incorporators: Hugh H. Donald, William A. McCarthy, etc., Toronto.

Wood-Working

Cochrane, Ont.—Elijah Eagle, formerly with the Preston Car & Coach Co., Preston, Ont., will build and operate a saw mill here.

Dundas, Ont.— Plans are drawn for additions to the factory of the Valley City Seating Co., consisting of two storeys, 50 x 50, brick construction, flat roof.

Vancouver, B.C.—A permit was taken out last week by Bettschen & Higgins for a two-storey woodworking factory at 1423 Charles Street, the estimated cost of which is $4,000.

Quebec, Que.—Fire did about $100,000 damage to the plant of the Valliere Furniture Co. The furniture factory and the sawmill were both destroyed. There is some insurance.

New Westminster, B.C.—A new Company, with $60,000 capital, has taken over the Walsh sash and door factory, and will employ 75 men. The Company's name is the Superior Sash and Door Co.

Preston, Ont.—The Preston Chair Co. factory is nearing completion. The machinery has been purchased, and is being installed. Operations should commence by the first of February.

Strathroy, Ont.—It is believed that the Canadian Handle Co., whose plant was destroyed recently, will not re-build here, but will enlarge the Columbia Handle Works, Adelaide St., London, and the plant at Tilbury.

Tenders

Ottawa, Ont.—Tenders were received on Jan. 9, by the Government for harbor works at Victoria, B.C., costing about $3,000,000.

St. Stanislas, Que.—The municipality of the parish of St. Stanislas of the River des Envies, Champlain Co., will receive until 15th February tenders for the construction of a steel highway bridge, 110 feet long, two abutments about 18 feet high, on the River des Envies. L. Germain, sec.-treas.

Vancouver, B.C.—Tenders will be called by the Burrard Inlet Tunnel & Bridge Co., for the new bridge at the Second Narrows, in accordance with the plans prepared by Sir John Wolfe-Barry. The estimated cost is $2,500,000. Tenderers will be asked to figure on the cost of the substructure, superstructure and entire bridge, including the approaches.

Ottawa, Ont.—The Marine and Fisheries Department is calling tenders for the construction of a gasoline launch for the fishery patrol service on the B. C. coast. The required dimensions of the craft are: Length over all, 55 feet; beam, 12 feet; and draft, 5 feet. The engine will be a three-cylinder, four-cycle, 8 x 10 Samson engine or any other engine satisfactory to the department.

Contracts Awarded

Ottawa, Ont.— The Government has awarded to the firm of Peter Lyall & Sons a contract for the construction of the new Edmonton armories, to cost $285,000.

Toronto, Ont.—The T. and N. O. Railway Co. has placed an order with the Pullman Car Co. of Chicago for two solid steel trains from baggage car to Pullman at a cost of $350,000. The Pullman Co. will deliver the fourteen cars in May.

St. Catharines, Ont.— The Niagara, St. Catharines & Toronto Railway has purchased six passenger cars which will be put on the Niagara Falls and Port Dalhousie lines. The cars, which are of the most modern type, are being made by the Preston Car & Coach Co. at Preston, Ont.

Ottawa, Ont.— A contract has been awarded by the Government to the Union Construction Co., of North Sydney, N.S., for the construction of a branch line to the Intercolonial. The cost is $67,571, and the line will run from a point on the I.C.R. at North Sydney station to a junction with the main line near Leitch's Creek Station, Nova Scotia.

Toronto, Ont.—The contract has been awarded by the Board of Control to the Canada Metal Co., for phosphor bronze castings at 22 cents per lb., and for babbit castings at 12 cents per lb.; to the Dominion Bronze Co. for Tobin bronze castings at 22 cents per lb.; and to the Martin Pump & Machine Co. for brass castings at 19 cents per lb.

General Industrial

Moose Jaw, Sask. — The Frampton Soap Co., of Seattle, have decided to open a factory in Moose Jaw.

St. George, N.B.—The St. George Pulp & Paper Co., South St., contemplate enlarging their pulp mill and erecting a paper mill.

Port Nicoll, Ont.—The C.P.R. will build a large addition to their elevator here, bringing the capacity up to 7,000,000 bushels.

Moncton, N.B.—Moncton Dairies, Ltd., recently incorporated, will take over the Hygienic Fresh Milk Co. at Sunny Brae, and enlarge the plant. Capital, $40,000.

Kildonan, Man. — Plans for a new building for the Winnipeg Paint & Glass Co., which will be erected in the spring, have been submitted to the council.

Lennoxville, Que.—Walter Blue & Co., Sherbrooke, Que., makers of clothing, have offered to erect a branch factory here if given a building and site and exemption for ten years.

Vancouver, B.C.— Theodore Hooper, architect, is preparing plans for factory buildings and wharf for the Royal Crown Soap Company, Vancouver, B.C. Machinery, etc., will be required shortly.

Burford, Ont.—R. McCracken announces that a larger and more up-to-date flour mill will replace the one burned a few days ago. The new structure will be modern in every particular.

Sherbrooke, Que.—The Ascot brick plant has been bought from D. G. Loomis & Sons, by the Sherbrooke Tile and Brick Co., who will manufacture tile and brick. New equipment will be installed.

New Toronto, Ont. — The Ontario Leather Co. plant has been sold to the Clarke & Clarke Co., manufacturers of leather goods, at 331 Christie Street, who will manufacture furniture leather and employ 75 to 80 men.

Brantford, Ont.—At a meeting of the shareholders of the Kitchen Overall Company it was decided to increase the capital stock to $80,000 from $40,000 for extensions.

Windsor, Ont.—J. T. Wing & Co., will build an addition to their soap factory, consisting of two storeys, 100 x 100, brick and steel construction, and the estimated cost is $30,000. Architect, J. C. Pennington.

Marlboro, Alta.—J. B. Griffith, sec.-treas. of the Edmonton Portland Cement Co., says that plans are being made to enlarge the 1,500-bbl. plant here, by installing a fourth kiln with a capacity of 500 bbl. a day.

Rossland, B.C. — The Nickel Plate Mine, owned by the Rossland-Kootenay Mining Co., London, England, which has been closed for ten years, will be reopened, and $50,000 to $100,000 spent on exploration work and diamond drilling.

Vernon, B.C.—Harry C. Moore, Blairmore, Alta., has written to the Board of Trade to find what prospects there are in this district for establishing a plant for the distillation of wood by the Pritchard process. He has also written to the Cranbrook Board of Trade.

St. John, N.B.—St. John's next new industry is likely to be a large plant for the manufacture of chemical fertilizer. A company, which is already doing a large business elsewhere, has been in communication with Secretary Hoag, of the Board of Trade.

Vancouver, B.C.—Baron Mitsui, a Japanese capitalist, will establish the largest flour mills on the Pacific Coast here, with terminals for the shipment of flour to China, and probably fleet steamers running between this point and the Orient.

Duck Lake, Sask.—The town has entered into an agreement with the Duck Lake Milling Co., whereby the Company will receive a free site of five acres and a cash bonus of $3,000. The Company will establish a 300-bbl. mill.

Alliston, Ont.—The Benedict-Proctor Co., silver plate manufacturers, have moved their plant here from Toronto, and Alliston will be their headquarters in future. Both F. G. Proctor and Edward Dorner will reside here.

Guelph, Ont.—The Peerless Rubber Co. will erect a plant here for reclaiming rubber. H. A. Middleton, of Rutherford, N.J., formerly superintendent at the Independent Tire Co., will be the mechanical head of the new Company.

Municipal

Mimico, Ont.— The ratepayers have voted in favor of spending $125,000 on a water and sewerage system.

Lumby, Que.—Debentures will be issued and a new water system installed. The village is 12 miles from Vernon.

Knowlton, Que.—The municipal council has recommended that an additional supply of water be obtained immediately.

Brooks, Alta.—The town requires estimates on lamp posts for illuminating purposes, and on fire fighting apparatus.

Whitby, Ont.—The ratepayers have approved the proposal to instal in the town a sewerage system costing about $115,000.

Aylmer, Ont.—A by-law is to be submitted to the people on January 19th for the extension of the intake pipe 2,000 feet further into the lake at a cost of $12,000.

Winnipeg, Man.—The city is considering the offer of the Economical Gas, Light and Power Co., Montreal, to instal a plant in competition with the Winnipeg Electric Co.

Hamilton, Ont.—In a few weeks there will commence a program of building and extension on various institutions in the city that will necessitate an outlay of over $7,000,000.

Winnipeg, Man.—City engineer Ruttan has made an estimate of the cost of operating buses in Winnipeg. Forty cars would cost $6,000 each, and the plant $70,000, making a total expenditure of $310,000.

Montreal, Que.— Controller Godfrey will recommend the building of a pumping station on the banks of the Lachine Canal opposite the present pumping station at Point St. Charles, with three pumps, costing $70,000, and to be finished in three weeks. This would be used only in case of an accident to the conduit.

Railways—Bridges

Toronto, Ont.—Steel work on the St. Clair Avenue bridge at Bathurst Street will be carried out during the winter.

Wiarton, Ont.—F. C. Cooper and D. Brown, of Lion's Head, are promoters of a proposed railway to penetrate the Bruce Peninsula.

Preston, Ont.—The by-law calling for a 25-year franchise for the Galt, Preston and Hespeler Street Railway was carried by a large majority.

Barrie, Ont. — The proposal to link Barrie with the C.P.R. Sudbury branch by electric railway and also give a local street railway service was endorsed by a good majority at the recent elections.

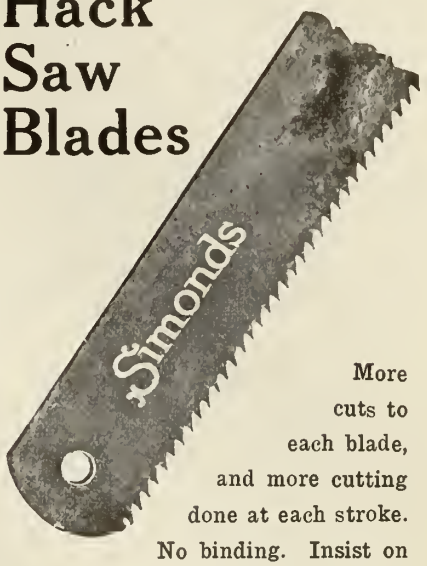
Vancouver, B.C.— The plans of the proposed extension of the B. C. E. R. Sapperton line from the present terminus, across the Brunette river, and along North road, Burquitlam, are completed according to G. R. G. Conway, chief engineer of the Company.

Ottawa, Ont.—A deputation representing the North Railway Co., Montreal, waited on the Government last week, and asked for a bond guarantee of $35,000 per mile on the line which the Company is planning between the National Transcontinental Railway and the city of Montreal.

Ottawa, Ont.—Heavy appropriations for the Intercolonial Railway will be in the estimates at the coming session, a portion of which will be employed for repairing the line from St. Rosalie to Halifax, a distance of 700 miles. All big curves will be eliminated, and grades reduced.

Marine

New Westminster, B.C.—The reconstruction of the Great Northern ferry slip will be commenced shortly to accommodate the new three-track ferry to be put on between this city and Sydney, Vancouver Island. Instead of making more frequent trips, a larger ferry will be put on the run as soon as the slip is rebuilt. The slip will be 400 feet long, three tracks wide, of very heavy construction, with an overhead bridge for raising and lowering the apron.



Trade Gossip

The Clay Products Association will hold their Annual Convention in Toronto on Jan. 27, 28, 29 and 30.

The Quebec Government has introduced a bill for the establishment of technical schools in the Province of Quebec.

Winnipeg is considering the appointment of an assistant to City Engineer Ruttan to succeed the late R. D. Wilson.

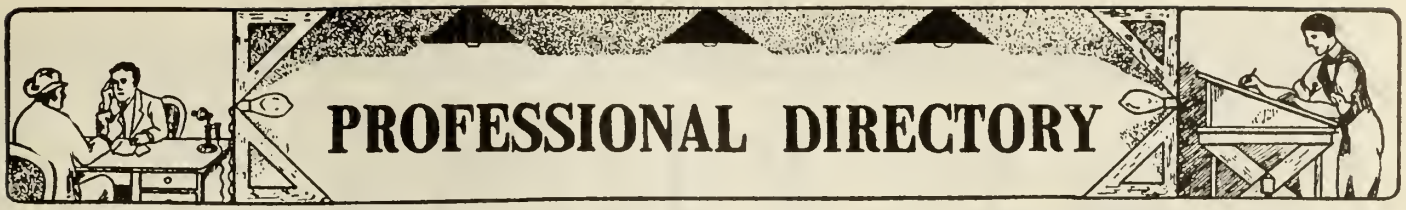
Toronto, Ont.—The Grand Trunk Railway Co. will re-open their shops at the foot of Spadina Avenue. It is intended to do all the repairing of their coaches, which will include the painting of them. Employment will be given to fifty men at once, to be increased later.



The Canadian Car and Foundry Co., Montreal, state that when the plants at Turcot and Blue Bonnets are reopened only 50 per cent. of their employees will be re-engaged. Orders on hand amount to about $3,500,000, and will keep the passenger equipment department busy until October. Orders for freight cars are, however, very light.

The Rudel-Belnap Machine Co., Ltd., 26 Adelaide St. W., Toronto, have been appointed agents in Ontario for the Kearney & Trecker Co., Milwaukee, Wis. This firm also represents the American Tool Works Co., Cincinnati Planer Co., Acme Machine Tool Co., all of Cincinnati, O., the Steinle Turret Machine Co., Madison, Wis., Long & Alstater, Hamilton, O.; Baker Bros., Toledo, O.; Merrill Mfg. Co., Toledo, O.; and the Platt Iron Works, Dayton.

The Massey-Harris Co. held the annual banquet of the Quebec branch in their Montreal offices on Wednesday, Dec. 7. One of the speakers drew attention to the fact that although the cost of living was going up, agricultural implements were getting cheaper every year. Among the speakers were John A. Bain, of the Bain Wagon Co., Woodstock; Thomas Findley, general manager; and J. C. Pare, assistant manager.

Sir Percy Girouard has been elected president of the Armstrong Whitworth Company of Canada, Ltd., who have recently erected a plant at Longueuil, Que., near Montreal. At a meeting of the shareholders held in Montreal on Friday last, the following directors were elected for the ensuing year:—Sir Percy Girouard, K.C.M.G.; Right Hon. Sir G. H. Murray, P.C., C.B.; A. W. A. Noble, G. G. Foster, K.C.; M. J. Butler, C.M.G. G. G. Foster, K.C. was elected vice-president

Steel Mills to Resume.—Orders have been posted in a number of independent steel mills placing the plants in full operation on January 12, due, it is said, to the appearance the past few days of specifications calling for approximately 100,000 tons of finished steel for immediate delivery. Operating officials expressed the opinion that the depression, which for four months has affected the industry, was passing. The orders affect some 5,000 men who have been idle or working one-fourth time

Patterns, Finished Machines.

Machinery Built on Contract

in the finest equipped shop of its size in Canada

The
Gray Mfg. & Machine Co.
Limited

686-692 St. Clarens Ave. Toronto

A high-speed Vanadium steel, of great hardness and durability of temper, yet so easily worked that it may be made into hacksaws and files. Such is

"DUROR" TOOL STEEL

made in Sheffield. You're always looking for some way to boost production and keep down expenses. Then try out "Duror." We have it in stock as

Bars Hacksaws Files.

W. A. Martin & Co.

70 Lombard St. Toronto

STEEL & IRON CASTINGS

OF ALL KINDS.
From 1 lb. to 15,000 lbs.

You can have your patterns made here, and castings machined.

NEAREST STEEL FOUNDRY to the MARITIME PROVINCES

Careful attention and prompt delivery.

F. X. DROLET QUEBEC P.Q.

MACHINIST & FOUNDER

CUT GEARS

When you want a gear cut you want it quickly. We emphasize our promptness without sacrificing accuracy.

SPRING WINDING MACHINES

for wire up to 3-16 in. diameter. For springs of any length or diameter, either open or closed. A small machine but a big time and money saver.

Hand Power BENDING TOOLS

for blacksmiths, machinists and concrete workers. For making angles, eyebolts and concrete reinforcements.

A. E. WHITEHOUSE, 76 St. George St., Montreal

BIG

RESULTS
from small investments. This little advertisement will give you an idea of the use you can make of smal space.

Danger Eliminated

The Allen Safety Set Screw eliminates all danger of accident from revolving set screws by removing the cause — the projecting screw head. It gives perfect safety, service and satisfaction without interfering with the efficiency of your men.

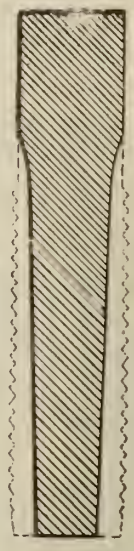
NORTHERN CRANE WORKS, Limited
WALKERVILLE, ONT.

NORTHERN CRANES

ELECTRIC AND HAND POWER
ALL SIZES, CAPACITIES AND TYPES
ALSO ELECTRIC AND AIR HOISTS

Little Giant.

The Reinforced Tap



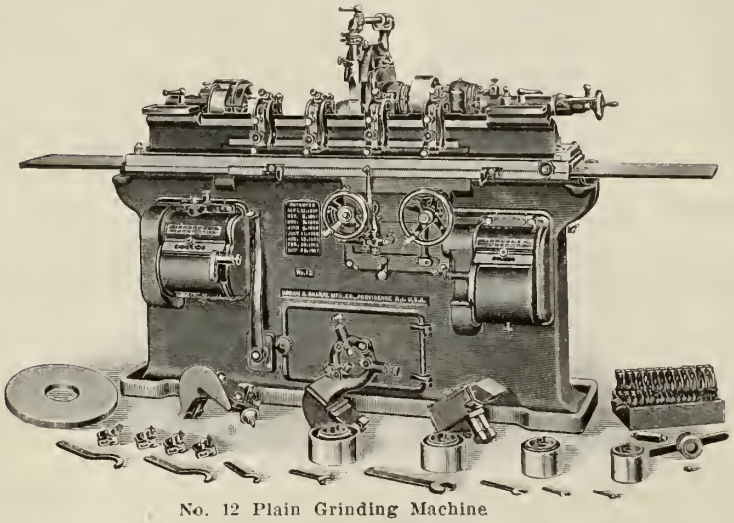
Resistance is offered to every tap at one end.

Power is applied to the other end.

If a tap breaks under a severe strain, it breaks at the **weakest spot** between these two extremes, i.e., in the threaded portion.

The backbone of the **L-G** Tap gets stronger toward the shank, so the "weakest spot" is the point and **we guarantee that.**

Note the reinforced design



Made in Canada by

Canadian Tap and Die Company, Galt, Ontario

Speeds and Feeds Quickly Changed Without Shifting Belts

The changes of speed and feed are independent of each other, and are made by shifting levers on the gear cases, which are conveniently located at either side of the operator.

No. 12 Plain Grinding Machine

Consider the increase in the efficiency of the operator resulting from this easy method of controlling the machine. When distributing work, the foreman usually gives advice as to the approximate feed and speed to use on the work, but it lies with the operator to shift these about until the combination best suited to the conditions is obtained. Such manipulation of the work speed and table feed required on manufacturing work is only convenient on a grinding machine equipped with quick change gear cases.

Send for copy of our book, "Points About Grinding Wheels." Also ask for a special circular of the No. 12 Plain Grinding Machine.

The Superiority of CYCLONE CHAIN HOISTS Increases with the Size

The ingenious eccentric gyrating gears, used only on "CYCLONE" Chain Hoists, give so great a speed reduction, in so compact and simple a form, that the superiority of the "CYCLONE" becomes more marked with every increase in capacity.

In sizes from 3 tons up, the "CYCLONE" is lighter in weight, much more compact, has fewer pendant chains, and a shorter distance between hooks than other hoists. This, of course, makes it much more convenient for practical work.

In addition, the CYCLONE has self-lubricating graphite-bronze bushings, an exceptionally smooth-working and efficient brake, and a higher efficiency, particularly in the larger sizes, than any other hoist made.

We are prepared to ship direct from any of our four warehouses. Write for Booklet and full particulars.

John Millen & Son, Limited

Montreal Toronto Winnipeg Vancouver

Are you acquainted with the merits of our

"Dennisteel" Lockers

Special Features

1. Made of Special Sheet Steel with angle Steel Frame.
2. Prevent loss by fire and reduce Insurance rates.
3. Promote order and system among employees.

Our Catalog gives other valuable information. We will mail it on request.

Dennis Wire and Iron Works Co., Limited

LONDON, CANADA

"Detroit" High-Speed Drills

uphold every pledge of quality, workmanship and service that we make for them. Each one is backed by our unqualified guarantee (look for the trade-mark) and

No Better Proof

of our reliability can be given than that we refund the purchase price for any which prove unsatisfactory. Did the drills and other small tools you used this year give perfect satisfaction?

Give "Detroit" Tools a test on some tough jobs; then make your 1914 requisitions.

Catalog "R" on request

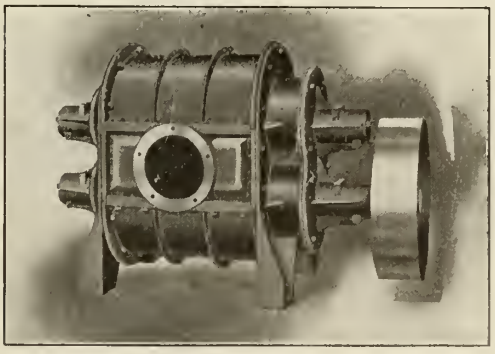
TRADE MARK TRADE MARK

Do You Burnish A Bushel Of Small Metal Articles with 15 Minutes' Labor?

If not, why not? Why should you pay experts for hours or days of hand-buffing, when you can get the same work done better at a labor cost of only a few cents?

The Abbott Burnishing Barrel



will take from a peck to a bushel of small metal articles at a time, and burnish them perfectly in one to five hours. The operating cost is a couple of cents worth of soap chips, some water, one-half to one horse power to run it, and about five cents worth of time (15 minutes) for one operator to load and unload it. Nor is this economy at the expense of quality, for the finish is smooth, hard, brilliant and uniform—no broken or bent parts—no material removed. It is economy plus efficiency.

Write for free booklet and approval offer
And send along samples for burnishing.

The Abbott Ball Company

1047 Elmwood Avenue **Hartford, Conn.**

BLOWERS

ROTARY POSITIVE PRESSURE TYPE

Weighs less and occupies less space for the same displacement per revolution than any other two-impeller blower.

THE ONLY ABSOLUTELY FIREPROOF MALLEABLE PLANT IN CANADA

CASTINGS

High Grade Malleable Iron Castings
CAPACITY OF 5000 TONS
Let Us Quote Prices
CANADIAN MALLEABLE IRON CO. LTD.
OWEN SOUND, ONT.

CASTINGS

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

STEEL CASTINGS

All Sizes, ¼ lb. to 30,000 lbs.

We make New Process Converter Steel Castings, annealed and unannealed: also Chrome Manganese and N'ckel Steel Castings.

Our Castings are perfect, yet they can be procured at a price that will ensure economy.

Every one guaranteed.

Ask us for estimates.

Casting for a 10,500 H.P. Water Wheel

JOLIETTE STEEL CASTINGS WORKS, Limited
Head Office and Foundry: JOLIETTE, P.Q.

THE
Steel Company of Canada
LIMITED

PRODUCERS OF
PIG IRON
Foundry Basic Malleable

Bar Iron Bar Steel
Plain Bars and Twisted Squares for reinforcement of Concrete

Bolts and Nuts, Tacks, Screws, Wire Nails, Rivets, Wire
Immediate Shipment all Standard Sizes
Prompt Attention to Orders for Special Sizes

Wrought Pipe, Bale Ties, Lead, R. R. Track Equipment, Field Fencing

John Wanamaker says that advertising doesn't jerk — it PULLS. He ought to know, and yet some men think that advertising should go against all rules and precedents and jerk them to success with one tremendous yank.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

How About New Barrels for the New Year?

EVEN if your old style horizontal barrels do hold out another year—you won't be saving much—not half as much as you would if they were replaced now with

GLOBE TUMBLING BARRELS

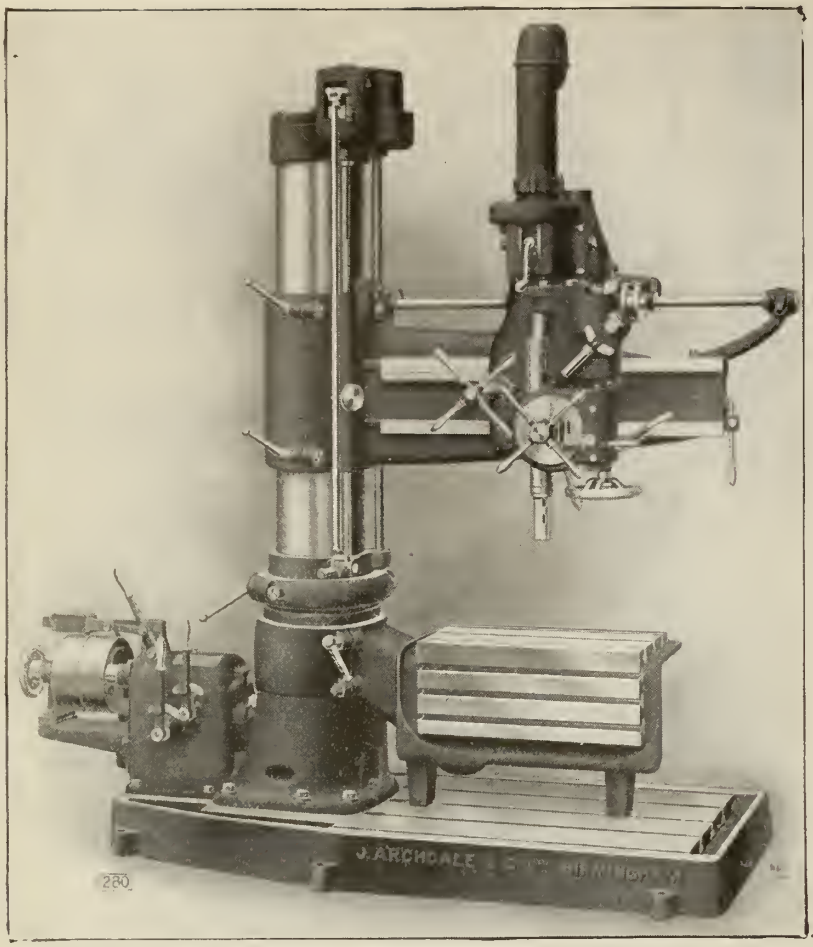
These barrels really economize for you. They cut down the running time, do better work, take up less floor space and eliminate lost motion.

The workman doesn't have to stop them for filling, emptying or even for inspecting the work. And when you want to switch from gentle to violent tumbling it's simply a matter of adjusting the running angle of the barrel.

Now these features may not mean much on paper, but if you once saw the barrels in operation it wouldn't take you long to decide that you needed them. Suppose we send you our catalog—which tells specifically what Globe Barrels will do for you.

THE GLOBE MACHINE & STAMPING CO.
Cleveland, Ohio, U.S.A.

Who Wants Your Order?



¶ The firms that are most likely to appreciate your order are the ones that are keenest to get it.

¶ The firms that advertise are bidding for your business in a broad, yet personal way,—the modern way. They are proud of their goods and are not ashamed to show them in public to the most critical.

¶ Patronize the firms that advertise. Consult this directory of machinery manufacturers and supply houses and you will connect with good concerns.

¶ A firm that appreciates your order will serve you well.

The advertiser would like to know where you saw his advertisement—tell him.

"W & B" Reamers are Backed by the "W & B" Reputation

The quality standard back of "W & B" Machinists' tools dates back 60 years.

The tools themselves have been the best advertisements and salesmen for "W & B" Products.

Satisfactory service is the best reason for 60 years of continuous growth.

If there is any indication that you are getting less than the best reamer service, investigate "W & B" reamers.

Write for catalog No. 82-G

A Larger P.&W. Vertical Shaper

New Model with 10½" Stroke of Ram

Since the 6" P. & W. Vertical Shaper was placed on the market about two years ago, you have undoubtedly regretted the fact many times that its capacity is not larger. You have work which you have wanted to do on this machine, but could not because its capacity was too small. For this larger work we take pleasure in offering you the

New 10" P.&W. Vertical Shaper

Differs from 6" Machine in some Features

Power Rotary Feed. The 10" Vertical Shaper is provided with power rotary as well as longitudinal and transverse power feeds.

Compact Feed Mechanism. The entire feed mechanism is self-contained in one compact unit on the right side of the saddle. The longitudinal, transverse and rotary power feeds are conveniently engaged, disengaged and reversed from this unit.

Powerful Worm and Wheel Drive.

Power is applied to the ram through a powerful worm and worm-wheel drive.

Why the Vertical Shaper Should Appeal to You

In the first place it is a machine of great range and you should never have any difficulty in keeping it busy. It will handle efficiently both slotting machine and horizontal shaper work in addition to work for which its distinctive features make it particularly adapted.

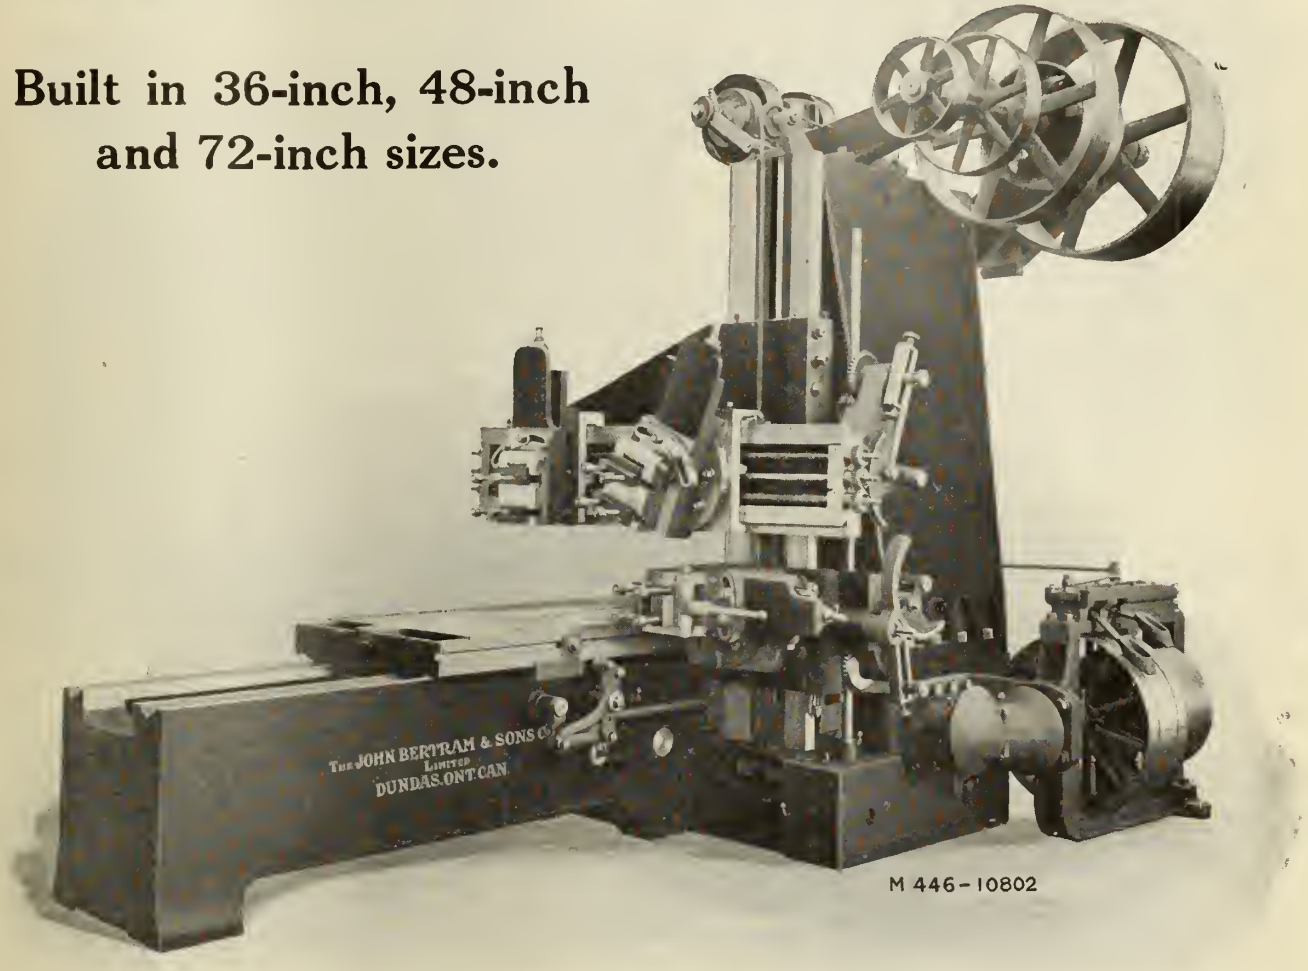
With the angular adjustment of the ram, this machine is in a class by itself on die work, convex, concave and irregular surfaces.

Swiveling ram head enables tool to be set in most convenient position; also various sides of work can be machined at one setting and with much greater accuracy than possible on horizontal shaper.

Although machine is proportioned to give unquestioned stability and provided with ample power for every requirement, it is a precision tool of great accuracy. The cutting stress holds the table and slides together and there is no tendency for the table to yield as on the horizontal shaper.

The entire control is within easy reach and conveniently operated.

Ram may be started and stopped independent of driving motor by means of clutch.



Pratt & Whitney Co., Hartford, Conn., U.S.A.

GARVIN No. 2-A (ALL FEEDS) Universal Milling Machine

IS THE MACHINE FOR YOUR TOOL-ROOM——RIGID AND ACCURATE

GARVIN No. 2-A Universal Milling Machine
(Automatic Feeds in all Directions)
Use Code - - - ANIMUS

Power Feed with reverse and automatic trip is provided in all directions, table, in and out and up and down. The feed movements are all controlled by one handle, with which the knee, saddle or slide can be started, stopped and reversed. The table has an independent trip handle in addition.

Ten positive Feed Gear Changes are secured, doubled to twenty when back-gears are used. The accelerated feed of table is received, when large diameter cutters are being used and the spindle is running slow. The Feed can be changed while machine is in cut.

Machine is equipped with our Double-Geared Dividing Head, our

SOLID TOP EXTENDED (Patented) KNEE

and many other valuable features exclusive to GARVIN Milling Machines.

DIMENSIONS

Automatic Table Feed	25 in.
Automatic Feed of Saddle	8 in.
Automatic Feed of Knee	18 in.
Dimensions of Table over all	48x9 in.
Taper Hole in Spindle B & S (positive Drive)	No. 10
Width of Belt required	3 in.
Number of Speed Changes	16
Number of Feed Changes	20
Floor Space required	74x84 in.
Crated Weight	3,500 lbs.

NICHOLSON MADE

FIRST—

Get the NICHOLSON-Made File That Best Suits Your Work.

THEN—

Use More of Them.

A dozen wrong-type files won't give you half the satisfaction of a single file that's right for your use.

When you specify NICHOLSON-MADE FILES, you simply can't go wrong.

Over 4,000 distinct patterns and sizes make it an easy matter to get the RIGHT file for your work.

And a NICHOLSON-MADE FILE represents the highest possible efficiency for its type.

Made from the RIGHT grade of steel—
Cut on our own special-built machines—
Inspected and tested after every important operation—
Embodying the results of 50 years in making great files,

each NICHOLSON-MADE FILE is a tool of matchless efficiency and economy in its particular field.

To get MAXIMUM File Service, use NICHOLSON-MADE FILES. To get the MAXIMUM service from NICHOLSON-MADE FILES, discard them as soon as they become half-worn.

The extra expenditure of 15c for a new file generally means a $1.50 saving in labor and time.

STARRETT

What Is Your Hack Saw Problem?

Are you "up against it" in your shop on the hack-saw problem. Do your men complain about the saws breaking in the hand frames? Do you find that your power machines are too hard on the blades you're using? Do the teeth break out? Do the saws get dull too quickly? Do they give out under the strain put upon them by the high speed power hack saws that economical cutting to-day demands? We know that whatever your problem

A Starrett Hack Saw Will Solve It

42-134

because we have helped out so many others in the same way. There's a Starrett blade for every job. Some one of the full line of hack-saws is just what you need whether you're cutting sheet metal, or tubing or steel girders. Starrett Hacks are made of the best steel tempered by our own process. The teeth are cut right and the set is just enough to clear easily yet not enough to waste power and stock. That's why Starrett Hack Saws cut quick and last longer.

Catalog 203 contains some good saw information. May we send it?

Starrett Tools are sold at all good hardware stores.

Concerning the Keeping of Cast Iron Wheel Records*

By H. H. Vaughan**

This paper describes the methods now adopted by a leading railway for keeping track of the life and behavior of chilled cast iron car wheels. The statistics compiled give the general results obtained from a given batch of wheels, no attempt being made to obtain individual records.

PRACTICALLY all railroads have abandoned any form of cast iron wheel record which follows the history of each individual wheel. Apart from the enromous amount of work in reporting and entering the movements of several hundred thousand wheels which are in service in a large system, it is practically impossible to avoid incorrect numbers being reported.

The difficulty of straightening out the errors that arise, errors which frequently were not disclosed for years after they actually occurred, and the correspondence involved in the attempt, were sufficient reasons for discarding a system that did not furnish sufficient useful information to justify its expense. The writer has not investigated methods used on other roads to describe them with accuracy in this paper, but believes that apart from the records maintained for guarantee purposes, the only systems in general use are those in which the average life of wheels removed from service for various causes, is determined in various ways. It is usual to show a figure for the average life of wheels obtained by dividing the number in service by the number removed per year, but this figure is not of much value as it depends more on the rate at which the number of wheels in service increases, than on the actual life of the wheels removed. Thus if a number of wheels in service remained stationary for a period of years, while the number of wheels removed increased 25 per cent., it would indicate a decrease in the average life of the wheels of 20 per cent., while if during the same period the wheels in service had increased 50 per cent., the same increase in the number of wheels removed would indicate an increase in the average life of 20 per cent.

Now if the increase in the wheels in service had taken place in two or three years, it would have had comparatively little influence on the wheels removed, so that an increase in the life of the wheel might be shown by these figures, while a reduction had actually occurred. In addition reports of wheels removed on foreign lines are not obtained correctly, especially for wheels removed on handling-companies' account and in general it is not uncommon for a life of twelve to eighteen years to be shown for wheels, when as a matter of fact they are lasting about five or six.

Method of Obtaining Records.

The figures showing the life of the actual wheels removed can be obtained with considerable accuracy and with simple reports and records. Each wheel is marked with its number, the date cast, etc., so that no complications are introduced by recording the date put into service and the date removed. While no record is usually kept of any time the wheel may be out of service, or the movements of the car under which it has been placed, these factors are relatively unimportant on a large number of wheels, and the average life of the wheels removed is a figure of sufficient importance on any road to justify the records and statements required. It should properly be kept by weight of wheels, so that any alteration that occurs in the life of wheels under the same weight of equipment may be distinguished from the changes due to the introduction of a greater proportion of heavier equipment or similar causes.

While the average life of wheels removed affords valuable information over a period of years, it does not enable the result of any variation in the quality or service of the wheels to be detected until considerable time has elapsed, and then only in a general way. When the wheel foundry methods of the Canadian Pacific Railway were revised in 1908, it became desirable to introduce some system by which it could be determined whether better service results were be-

FIG. 1. CONCERNING THE KEEPING OF CAST IRON WHEEL RECORDS.

ing obtained or not, without the complications of the old individual records.

This was accomplished in a satisfactory and simple manner by comparing for each year's make of wheels, of the same weight and manufacture, the number removed for various classes of defect in each year of their life. This system is shown in Figure 1—which gives the results for 600-lb. wheels cost by the Canadian Pacific Railway in 1902, the first year for which this statement was prepared. Similar statements have been made up for the same weight of wheel with its subsequent modification to 645 lbs. and 625 lbs. up to 1912, one of the manufacturers and operating defects, is broadly affected by the quality of wheels turned out, so that the statement, Figure 2, is a record of the foundry output in this respect.

This statement shows several interesting features. There is evidently a decided variation in the percentage of the

FIG. 2. CONCERNING THE KEEPING OF CAST IRON WHEEL RECORDS.

does not require any additional reports over those commonly used. The only information needed is the make of the wheel, weight, date cast, maker and cause of removal, items that are likely to be reported accurately and which are those required for a record of any kind. As the number of wheels of any group cast in each year are known, the number removed in each year's life for each cause may be expressed as a percentage of the number made, and this percentage may be compared year by year to determine the comparative service obtained from the different wheels.

As the records are compiled in the Canadian Pacific Railway, no attention is paid to the date the wheel is put into service. For wheels made in any one year, the number removed in that year are taken as being removed in the first year of their life, those removed in the next year, as in the second year of their life, and so on. This introduces an inaccuracy in the case of any particular wheels placed in service towards the end of the year, but the error becomes unimportant after a year or so, and the labor of compiling the record is greatly reduced.

The statement obtained by this system has advantages of this system being that with the records that had been kept it was possible without too much work to go back as many years as necessary to compare the results with those of previous years.

This statement, Figure 1—while giving all the information that is obtained for the wheels it refers to, does not enable any comparison to be made easily, and for that purpose a series of such statements for wheels made in successive years are combined as shown in Figure 2. This statement shows the number of the wheels of the weight it relates to made in each year, and the percentage removed in each year of their life for all causes, except worn flange, slid flat and removed from tenders. A similar statement, Figure 3, shows the percentage removed each year for worn flange, and slid flat and a similar statement, Figure 4, shows the percentage of broken wheels and broken and chipped flanges for the same series. It is evident that similar statements may easily be prepared for any cause of removal it is desired to investigate, but those shown are the ones that have been considered important. The elimination of wheels slid flat, worn flanges and removed from tenders, leaves a balance, that while not corresponding to the classification of wheels removed of different years' make, and it is only reasonable to suppose that where a larger percentage is removed in a given time, say, six or seven years, the life of the wheel is less. If this be granted, some years' makes are evidently considerably superior to others; for instance, those made in 1904 were far better than the average, while those made since 1908 have been uniformly good.

If all wheels made were accounted for, there would, of course, be no assumption involved, but by an inspection of Figure 1 it will be seen that of the wheels made in 1902, only 51 per cent. have been accounted for in 1912. It is improbable that 49 per cent. are still in service, and the difference is, therefore, to be accounted for by wheels placed under foreign cars or removed on foreign roads and not reported. This discrepancy might be reduced if the number of wheels of any make placed under foreign cars were deducted from the number made before calculating the percentage, but it would introduce a complication of doubtful advantages. The chief effect of this factor is in comparing wheels received under new cars

with those made or purchased for renewals. The former will evidently not be placed under foreign equipment to the same extent, but as this number has been under 10 per cent. of the total number placed in service each year its effect can be allowed for.

The reliability of the statement as a whole is confirmed by the fact that since 1908 it shows a decreased percentage of wheels removed, and that the average life of the wheels removed has since that time increased as follows:

Year.	Manufacturers' Defects.	Operating Defects.	Total.
1908	5 Years 2 Months	4 Years 5 Months	4 Years 8 Months
1909	5 " 2 "	4 " 7 "	4 " 9 "
1910	5 " 7 "	4 " 9 "	5 " 0 "
1911	5 " 4 "	4 " 9 "	4 " 11 "
1912	5 " 9 "	5 " 0 "	5 " 4 "
1913	5 " 11 "	5 " 5 "	5 " 7 "

An important point in this statement is the general agreement of the results shown throughout the life of any series of wheels with those shown in the first year or two. It appears almost certain that if the wheels are of good quality and carefully inspected that there will be less poor wheels to fail in the first year or so, and this result will persist throughout their life. This result is certainly true in the case of 1904 and 1908 wheels, and if it is confirmed by further experience, this form of statement furnishes a simple method of determining within a comparatively short time the service that may be expected from any group of wheels without the necessity for complicated records.

Figures 3 and 4 are also interesting statements. Wheels slid flat and worn flanges are not chargeable against the foundry, but they may be largely affected by the shops. Careless taping and mating, cars down on side bearings and sundry other causes for worn flanges, are all avoidable, and results may be followed by means of this report. Slid flat wheels are also caused by improper maintenance and operation and may be largely reduced by care.

It will be seen from this statement that there is comparatively little difference between the wheels removed for being slid flat of the various years' make. There is, however, a most decided difference in the number removed for worn flange, the wheels made in 1906 being considerably better than those of previous years, while there is a still greater reduction in 1908. The percentage of 1908 wheels removed in five years from this cause is only about 40 per cent. of the number removed in an equal time of the 1906 wheels and less than 20 per cent. of the corresponding number for the wheels made in 1903, 1904, and 1905. In 1908 the method of taping was carefully gone into and the work carried on with greater care, so it would appear that the proper carrying out of this work is most important to avoid injury to wheels from worn flanges. To the end of the fourth year the 1909 wheels are even better, so that the 1908 results were not simply accidental, but the consequence of greater care and better methods.

Figure 4, showing broken and chipped flanges and broken wheels, is also instructive. Unfortunately no distribution is made between broken and chipped flanges, but two facts are certainly shown. The most important is that broken and chipped flanges have been greatly reduced since 1908, and since there seems no reason for any change in the chipped flanges, it is to be hoped that the broken flanges have been largely eliminated. The second is that broken wheels are a most unimportant factor, the number rarely amounting to

FIGS. 3 AND 4. CONCERNING THE KEEPING OF CAST IRON WHEEL RECORDS.
W. F., S. F., B. F. and B. W. Signify "Worn Flange," "Slid Flat," "Broken Flange" and "Broken Wheel" Respectively.

one-tenth of 1 per cent. in ten years. These facts are of the greatest interest as showing the excellent service that may be obtained from a well-made chilled wheel.

Figures 5, 6, 7 show similar statements for the wheels supplied by three separate manufacturers, giving the same information for the same weight of wheel as Figures(2, 3 and 4. It will be seen in Figure 5 the 1907 wheels from manufacturer "A" compare very closely with the 1908 C.P.R. wheels on the percentage removed for foundry causes, but that for the balance of the groups of wheels, poorer results are shown. In Figure 6 the removal of wheels for worn flanges from manufacturer "B" is exceedingly small, while the number removed from other manufacturers compare with the later C.P.R. results. Wheels from manufacturers "B" and "C" were received under new cars, so that it would appear that in the case of "B" particular care was taken with the taping. In Figure 7 there is a peculiar circumstance. The broken and chipped flanges from manufacturer "A" were about equal to the earlier C.P.R. wheels, and greater in number than from the C.P.R. wheels made after 1907. Those from manufacturer "C" are closely the same as from C.P.R. 1908 and 1909 wheels, but there are practically no broken flanges and no broken wheels from manufacturer "B". This question is being investigated, but without any reason being so far obtained.

Reference has been made throughout this paper to the revision of the Canadian Pacific foundry methods in 1908 and to the results obtained since that date, which evidently show a considerable improvement. Prior to that date the mixture had been handled by brands and numbers, and, as the records show, in some years very good wheels were made, and in others the results were not as good.

In the years 1906 and 1907 considerable trouble arose, a large number of failures occurring in service, caused, as was subsequently discovered, chiefly by iron of widely varying silicon content, but of the same brand being used indiscriminately. The system of inspection was not sufficiently thorough to reject all wheels of improper quality, and while the records in use at that time did not indicate anything unusual, sufficient trouble developed in service to draw attention to the irregularity in the wheels.

Mr. Ira B. Lesh was engaged to organize the manufacture on a basis in which the mixtures would be accurately determined by chemical analysis and the inspection effective to reject any of the product that was not of the proper quality. A proper mixture is, of course, only one of the factors entering into the manufacture of a satisfactory wheel, and considerable attention was paid to other points as well, with the results that obvious defects disappeared, while the records show that a permanent improvement was obtained.

C.P.R. Practice.

It is not the intention to make this paper one of the manufacture of chilled cast-iron wheels, but in view of the enormous importance of the subject, it is interesting to describe the lines on which the Canadian Pacific practice has been developed and discuss the opportunities for improvement.

The writer considers one of the most important factors in obtaining good wheels is that of inspection. Absolutely uniform and perfect foundry practice is, of course, the great thing to obtain and the most difficult, but that is the portion of the subject which would be better described by some competent wheel manufacturer. Inspection should detect those wheels which for any reason depart from the accepted quality, and for this purpose the wheels to be tested should be selected with care and sufficient wheels broken from any day's run to ensure the rejection of any that are either too hard or too soft.

FIG. 5. CONCERNING THE KEEPING OF CAST IRON WHEEL RECORDS.

This may be accomplished by comparing the tapes and chill tests and rejecting all soft and hard wheels until it can be determined within reasonable limits that the wheels accepted are the good.

Inspection should, of course, detect all ordinary defects, but it can be carried on to properly protect the content to prevent the constant increment in sulphur which occurs from remelting with coke, but refers to the value of charcoal iron as against coke irons. Good results have certainly been obtained from the latter if properly handled, but on the other hand, if any advantage in strength can be shown for certainly appear that a light chill is a cause of weakness not only in the tread under heavy loads, but in the flanges. This may be explained by the structure being that of a hard rigid surface joined to a softer and less rigid back. Grey iron, while often considered as a rigid material, has only about 50 per cent. to

heat, and this is most important. One thing should be remembered, that out of the ordinary lot of wheels, 60 per cent. will run through their life and be removed without any defect that reduces the life of the wheel, so that it looks very much as though the question of getting the other 40 per cent. out of the way by better practice or improved inspection were the important ones.

Mixtures.

The question of mixtures is a very vexed one. Prior to 1908 charcoal iron was extensively used on the Canadian Pacific Railway, and the trouble that occurred was caused by its improper use and not on account of its quality. Since that time its use was abandoned for about two years, and it has subsequently employed to the extent of ten or fifteen per cent. of the mixture. In spite of the great reputation of charcoal iron, it is a question to what extent it can be better than coke iron after being melted up in a cupola heated by coke. This statement is not intended to refer to the use of iron with a low sulphur charcoal iron the additional cost is not worth considering. The great question at the present time is that of improving the quality of the chilled wheel. It has only one serious point of weakness, the danger of broken flanges. The records show that the number of broken flanges has been greatly reduced since 1908. If this is correct, the causes are, the reinforced flange, careful manufacture, good inspection and a rather hard wheel.

The reinforced flange was introduced in 1906-7 when the 600-lb. wheel was changed to 645 lbs., and it would appear that this change made a great improvement.

Depth of Chill.

The Canadian Pacific Railway practice has during the past few years run to a hard wheel, the rule being to use the M.C.B. limits for depth of chill, applying them to the pure white iron only. This was introduced on account of an investigation made on a number of wheels causing derailments on account of broken flanges, which showed that the majority were soft wheels, having 3/8 inch or less depth of chill. It would 60 per cent. of the rigidity of the white iron, which probably corresponds closely to that of hardened steel. When this compound structure is subjected to any force, placing a tensile strain on the surface, this strain is largely localized on the layer of white iron, the grey iron beneath it taking less than its share on account of its greater elasticity. It is, therefore, necessary to maintain a sufficient depth of white iron to resist a force of this nature, which is that brought on the flange by the rail, and it is evident that the white iron is greatly assisted when backed up by a large amount of grey iron, which is the case when the flange is reinforced, as in the latter designs of wheels. This is probably the correct explanation of the greater amount of flange breakage with soft wheels, and it is apparently confirmed by the results that have been obtained.

There is good ground for expecting that the use of the reinforced flange and better knowledge of the causes governing the strength of white iron may lead to considerably better results being ob-

tained from the chilled wheel in the future.

On light equipment with less severe brake service than is usual to-day, the chilled wheel has given excellent results and is even now most economical and satisfactory in most respects. Flanges practically never break through the line in which they are restricted in strength, and until they do so, there is every reason to hope that the east wheel may be able to hold its own, and in time to render the good service it has in the past.

SHOULD CHILLED CAR WHEELS BE ANNEALED ALL OVER?

IN a discussion following a paper read recently before the Canadian Railway Club at Montreal on the subject of "Cast Iron Wheel Records," the question was brought up of how best to strengthen chilled wheels in view of the ever-increasing loads imposed upon them by modern traffic conditions. Mr. E. B. Tilt, Engineer of Tests, Canadian Pacific Railway, remarked that at the Angus shops of that road test bars, 2 inches in diameter, had been cast with a chill extending right through them. These bars were tested, without being annealed, on a small drop-testing machine, and were found to have a strength superior to that found in the flange metal of car wheels cast from the same mixture and at the same time. The wheels had, of course, been annealed in the usual way before being tested, and that fact, the speaker stated, seemed to suggest that the life of chilled wheels might perhaps be prolonged if some means could be devised by which the grey iron portion of the wheel could be annealed, leaving the tread and flange in the same condition as when the wheel left the mold.

Such a method of annealing wheels has, of course, been adopted by foundrymen when a few wheels have been wanted in a hurry. In such a case, the plate of the wheel is covered up with sand as soon as it is removed from the mold, thus causing it to cool as slowly as possible, and so relieving the internal strains. While no detrimental effect has been observed from this rough-and-ready method of annealing, it is not known how the life of the wheel has been affected thereby, no records having been kept, but in view of the results on test bars obtained by the C.P.R., it would seem worth while following up the question more closely. The quality of the cast iron chilled wheel has improved to a very marked extent during the last ten years, especially in Canada; but if this wheel is to retain its place in railroad work it will have to be still further improved to meet the exacting conditions demanded by modern heavy traffic.

CANADA'S TRADE INCREASED.

THE trade of Canada during 1913 increased by $210,000,000 over 1912. This is the greatest increase in one year over a previous year ever recorded in the history of the Dominion. The total figures for 1913 are $1,085,264,449; of this, $686,604,413 was imports and $337,068,355 exports. The duty collected amounted to $114,501,670, being nearly $30,000,000 more than before.

Trade with France increased by $4,000,000, the increase being largely in imports, although half a million dollars worth of goods more than in 1912 was shipped to France. The total trade was slightly over $17,000,000.

Trade with Germany did not increase so much as did that with France. The increase was a little less than $3,000,000. The total trade done was $17,876,227, of which no less than $14,500,000 was imports and less than $3,500,000 exports.

Trade with Great Britain increased by over $48,500,000. The exports to Great Britain increased more than the imports from there. The imports were $139,646,356, a gain of nearly $22,500,000, while the exports amounted to $117,982,002, an increase of over $26,500,000.

Canada does nearly double the trade with the United States that she does with Great Britain. The United States trade amounted to $622,432,937 in 1913. This was nearly $137,000,000 over 1912.

FIG. 7. CONCERNING THE KEEPING OF CAST IRON WHEEL RECORDS.
B. F. and B. W. Signify "Broken Flange" and "Broken Wheel," Respectively.

Canadian General Electric Co. Ltd. 25th Anniversary

What follows constitutes the address given by Mr. Frederic Nicholls, President of the Canadian General Electric Co., at a meeting of Directors held on December 27, last, to commemorate the 25th anniversary of the organization of a syndicate to enquire into the feasibility of establishing in Toronto a system of incandescent electric lighting. The same syndicate subsequently organized the Canadian General Electric Co., Ltd.

MR. NICHOLLS in the opening sentence said: To-day is the twenty-fifth anniversary of the inception of the enterprise which later developed into the Canadian General Electric Co., Ltd. On the 27th of December, 1888, I called together a number of gentlemen then, as now, prominent citizens of Toronto, with a reputation as successful and public-spirited business men. They then affixed their signatures to a simple letter agreement to join me in a syndicate to provide a fund to defray the expenses of inquiring into the feasibility of establishing in Toronto an electric plant to supply electric light and power by means of underground wires. At that time I little thought of the tremendous development that lay before us.

At the meeting were present, besides myself as organizer, Messrs. W. R. Brock, W. D. Matthews, J. K. Kerr, Geo. A. Cox, Robert Jaffray, Hugh Ryan, and H. P. Dwight. Mr. Hugh Ryan and Mr. H. P. Dwight continued their association with us until death removed them, and to-day we can point to the unique record of six out of eight of the original directors who are still acting in that capacity, after an unbroken period of a quarter of a century.

Continuous Record of Success.

Twenty-five years ago our assets consisted of our capital of $10,000.00, ten of us having subscribed a sum of $1,000 each; to-day our assets are in the neighborhood of $25,000,000, or a steady growth and development at an average rate of $1,000,000 a year for twenty-five years in succession, and, as the chief officer of your company, I may be pardoned if on this special occasion I draw attention, with some little personal pride, to the fact that a dividend has been earned and paid in each and every year since our organization.

As a result of having had the good fortune or prescience to associate myself in the beginning with such able men as have formed our directorate, we have been able to so conservatively conduct our operations that, in addition to having paid out no less a sum than $6,286,744 in dividends during the past twenty years, a surplus nearly equal to 40 per cent. of the paid-up capital, both common and preferred, has been accumulated.

Gratifying Facts and Figures.

When I refer to the conservative and cautious policy that has been followed by the directorate, it is perhaps as well that I should substantiate this statement by facts:

1.—There is absolutely no "water" in the capitalization of the company, every share, both common and preferred, having been sold for cash at par or better, and the average cash received by the company has been $118 per share sold. This, I claim, is unique in the annals of Canadian industrials.

2.—We have sufficient cash and current assets to pay off every dollar of indebtedness, also the entire issue of preferred stock, and still leave nearly $50 in net quick assets for every share of common stock, in addition to all the capital assets.

3.—Notwithstanding the fact that the value of the real estate, buildings, and machinery owned by the company is greatly in excess of the values as they appear on our books, and, after deducting $1,100,000 reserved for depreciation, there remains $95 in capital assets for every share of common stock, so that the common stock represents a value of $140 a share.

4.—The company has created no bond or mortgage indebtedness, and consequently has no fixed charges, its liability in this respect being limited to having assumed from time to time the outstanding obligations of enterprises that have been acquired by purchase or consolidation with the parent company.

5.—Dividends paid to shareholders ($6,286,744), added to reserves accumulated from undivided profits, total a sum in excess of our total paid-up capital stock, both common and preferred, of ten million dollars. Our capital five years ago was $6,700,000.

Company Stock in Favor.

Some years since, when the growth of the company assumed such proportions that it was considered advisable to interest English and foreign capital, an issue of capital stock was placed on the London market. Since that time the British investor has absorbed more and more of the company's share capital, until to-day we have some three thousand shareholders, with an average holding of about twenty-seven shares of common stock, and, as one thousand of our three thousand shareholders are women, it would seem that our shares are favorably considered from a purely investment standpoint.

Toronto Incandescent E. L. Co.

The first company to be organized by the syndicate was the Toronto Incandescent Electric Light Co., on the 26th day of June, 1889, the intervening time since the organization of the syndicate having been occupied in negotiating an agreement with the Edison Electric Light Co., of New York, for the exclusive use of their system, and, by prolonged negotiations with the City of Toronto, for a franchise to generate electric light and power, and distribute the same by underground conductors. Mr. W. D. Matthews was elected president, Mr. H. P. Dwight and myself vice-presidents, and Mr. J. K. Kerr, solicitor, our bankers being the Imperial Bank of Canada. This company was very successful, and was subsequently amalgamated with the Toronto Electric Light Company.

Toronto Construction and Electrical Supply Co.

Our next venture was the Toronto Construction and Electrical Supply Company, which was incorporated on the 11th of February, 1891. Mr. W. R. Brock was elected president; Mr. H. P. Dwight and myself vice-presidents; Mr. J. K. Kerr, solicitor, and the Canadian Bank of Commerce, bankers for the company. This company was the parent of the Canadian General Electric Co. The officers remained unchanged until last year, when, after the death of Mr. Dwight, I was elected president to succeed Mr. Brock, who had accepted the office of honorary president and chairman of the board, and Messrs. W. D. Matthews and the Hon. J. K. Kerr, K.C., were elected vice-presidents. The Hon. J. K. Kerr, K.C., is still our solicitor, and the Canadian Bank of Commerce is still one of our bankers.

The business of the Toronto Construction & Electrical Supply Co., was the sale of electrical apparatus and supplies, and soon after its incorporation, on the 14th of October, 1891, it formed an alliance with the Thomson-Houston Electric Co., of Boston, and entered into an agreement to act as their sole agents for Canada. From the start we were very successful, and secured in a short time such favorable recognition from the purchasing public that negotiations were entered into for the purchase of all the Canadian property and interests of the Edison Electric Light Co., including their

factory at Peterborough, the Thomson-Houston and Edison interests in the United States having in the meantime been merged into the General Electric Company.

Canadian General Electric Co. Organized

After some delay in the negotiations, an agreement of purchase was concluded, and the Canadian General Electric Company was organized on the 5th of September, 1892, so that the Canadian General Electric Company, which was the outcome of the original investment of $10,000 by the syndicate of ten, has some time since attained its majority.

At the time of the formation of the Canadian General Electric Company, the capital assets consisted solely of the land and buildings at Peterborough, whereas to-day we own ten manufacturing establishments, the head office, and six branch office buildings. The factories comprise: The main Electrical Works at Peterborough; the Electric Porcelain Works at Peterborough; the Canada Foundry Works at Toronto; the Architectural Bronze and Iron Works at Toronto; the Electric Supply Works, Toronto; the Canadian Sunbeam Lamp Works, Toronto; the Bridge and Structural Steel Works at Bridgeburg, Ontario; the Canadian Allis-Chalmers Works at Montreal; the Tungsten Electric Lamp Works at Montreal; and the Flour Mill Machinery Works at Stratford, Ontario.

Branch Offices Feature.

At the inception of the company, the only branch offices were in leased buildings in Montreal, Winnipeg, and Vancouver, whereas to-day our branches are in Halifax, Montreal, Ottawa, Cobalt, Porcupine, Sudbury, Fort William, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Nelson, Prince Rupert, Vancouver, and Victoria, which enable us to cover the entire field of Canadian enterprise. In the more important centres, the buildings occupied are owned by the company, and have been constructed to suit our own requirements. Each district has an adequate staff, and carries a stock of merchandise suitable to the needs of our local customers.

C. G. E. Development.

At the time we purchased the Canadian property of the General Electric Company, we also acquired the exclusive rights of the Edison Company, the Thomson-Houston Company, the Fort Wayne Electric Company, and the Brush Electric Company, and since then have from time to time acquired the Canadian business and good-will of many other companies that have enabled us to extend our field of operation, including amongst others:

The Ball Electric Light Co.....	1892
The Peterborough Carbon Co....	1895
The Electric Storage Battery Co.	1898
The Canada Foundry Co.....	1900
The Royal Electric Co.....	1900
The Stanley Electric Co.....	1900
The Northey Steam Pump Co...	1902
The Sunbeam Electric Lamp Co..	1912
The Tungstolier Company	1912
The Canadian Holophane Co.....	1912
The Allis-Chalmers Mfg. Co.....	1913
The Stratford Mill Building Co..	1913

In May, 1901, the company purchased a valuable water power development, four miles from the Peterborough Works where our electric power for operating has since been generated, and in 1910 we secured a twenty-year leasehold from the Town of Peterborough of a part of their waterworks dam, where we have developed an additional 1,000 horsepower.

Our first head office was at 63 Front street West, Toronto, where only a few employees were required until, as the business grew, we had to secure more commodious quarters, and removed to 14 and 16 King street east, which we leased for a term of years. Outgrowing this building in turn, we, in 1908, removed to our present head office building, built by the company for our own special requirements.

The Future Outlook.

Having briefly reviewed our past history, I would like to say a word as to future prospects. I do not desire to pose as a prophet, for the reason that our own future must run parallel to the future development of our country.

Personally, I have the utmost faith in the future development and continued prosperity of Canada. Occasional setbacks we must expect, but the march of progress must be always onward, as so much of our great country still remains to be developed and populated. Next year, two new transcontinental railways, the Canadian Northern and the Grand Trunk Pacific, will be in operation for the first time, operating through trains from the Atlantic to the Pacific. The Canadian Pacific Railway have increased their trackage, rolling stock, and other facilities, at an expenditure equal to that required to build a new railway from ocean to ocean. The contracts for the new Welland Ship Canal have been let by the Dominion Government. Public works of great magnitude are either under construction or being projected by the Federal and Provincial Governments. Up to the present our immigration has continued to increase, so that, taking it all in all, the future is full of promise, even though for some short while we may experience a recession in trade, as a result of the present world-wide financial uncertainty.

Mr. F. A. Vanderlip, president of the National City Bank of New York, an authority on financial and trade statistics, in a recent address, made the statement that the intelligent development of the electrical industry in the United States will readily absorb for the next five years, $400,000,000 a year, or $8,000,000 a week.

Steam Railway Electrification.

I do not predict that in Canada our percentage of trade, on a pro rata population basis, will be so startling, but there is no reason why we should not expect a satisfactory growth in the demand for our products. A normal growth of population may be counted on. The trunk line railways will undoubtedly electrify certain sections, such as terminals and mountainous divisions, and I am pleased to say that the first two important contracts that have been let for the electrification of steam railways in Canada have been awarded to this company. I refer to the electrification of the Rossland-Castlegar division of the Canadian Pacific Railway in the Rocky Mountains, and the electrification of the tunnel under Mount Royal, and the Montreal Terminal for the Canadian Northern Railway.

In considering the future uses of electricity in Canada, we must have in mind the impetus this industry has received as a result of the utilization of our magnificent water powers. Few realize that from Quebec in the East, to Victoria, British Columbia, in the West, nearly every city, town and village has the advantage of hydro-electric power for its lighting, its street railways, and its industries. Quebec, Montreal, Ottawa, Toronto, London, Port Arthur, Fort William, Winnipeg, Calgary, Vancouver, Victoria, and intermediate points, are all operating electrically, and our reserves of water powers undeveloped will serve the needs of the country beyond our time.

THE MANUFACTURE OF MODERN METAL FILAMENT LAMPS.

IN the Zeitschr. des Ver. deutsch Ingen of October 11, 1913, Mr. Otto Ruff describes the principal stages in the preparation of the metallic filaments for incandescent lamps, including the production and working of the tungsten rods, the drawing of the wire therefrom and the manipulation required in the making of lamps out of the wire. The author first points out the advantages of this type of lamp, since the tungsten filament is much more refractory than the carbon filament, and gives a better luminous effect. The metallic tungsten is generally obtained in the form of a fine powder which is difficult to compress, and when it is successfully compressed, the metal obtained is not sufficiently ductile to permit of being drawn out; hence the preparation of the filaments presents considerable difficulties. In order to transform the tungsten powder, which must be very pure, into a sufficiently flexible and resistant filament, the following procedure is adopted:—

The metallic powder is first strongly compressed in a steel mold, and a very fragile rod is produced which must be made stronger by reheating. This operation is carried on in a tubular furnace, in which the rod is first heated gradually to a red heat, then to a temperature higher than that employed in the chemical preparation of tungsten powder. The whole operation is carried out in a current of hydrogen. The rods are next sintered by exposure to a temperature of 2,850 deg. cent. in an electric furnace, on leaving which they have a coarsely crystalline appearance. During this sintering process the metal contracts to the extent of 14 per cent.

The resistance of the rod is now such that it may be drawn out either by hammering or rolling, and this operation is generally effected by means of a special rapid hammering machine at a temperature of about 1,300 deg. Cent. When the diameter of the rod has been reduced to about three-fourths of a millimetre, the ductility of the metal is sufficient to allow it to be cold drawn. It is preferable, however, to do this with special heated draw-plates, by means of which the diameter is reduced to one-fortieth of a millimetre. Before being mounted in the lamp, it is again reheated in a current of hydrogen to remove a thin coating of oxide.

CANAL HOSPITAL SERVICE.

CONDITIONS approaching those of a well equipped army will prevail in connection with the building of a new Welland Ship Canal. Dr. McCoombs is in charge of the hospital and medical service which the Government is instituting, and says:—

"The main hospital will be on the Havens farm on the Queenston and Grimsby road. This will be thoroughly equipped, and capable of providing accommodation for thirty patients, with small separate places for men suffering from infectious diseases. There will be a thoroughly competent staff of nurses and doctors, as well as good office and clerical staff. At Thorold, we shall have a small branch hospital for about ten patients. This will be used as an emergency hospital, in case of bad accidents. There will be another such branch hospital at Fort Weller.

"Along the line of the canal, dispensaries will be located, where the men who are sick will receive medicine. Three doctors will be constantly patrolling the canal, so that there will be no lack of attention. An ambulance will be established and small stretchers will be in every camp. It is my intention to have the clerks and timekeepers on the canal thoroughly drilled in first aid work. Each will have a medical and surgical case and be taught how to handle it. We shall give a prize of $50 every six months to the man who proves most efficient."

CANADIAN HARBOR WORKS.

TENDERS received on January 9 for harbor works at Victoria, B.C., costing about $3,000,000, round off the list of extensive harbor improvement inaugurated by the Government in all parts of the country. Every port of any importance now has under way works calculated to vastly increase the transportation facilities of the country. The total cost, when all are completed, will probably be around $75,000,000.

Halifax is getting modern ocean terminals for the Intercolonial Railway, and a large dry dock is to be built. St. John has the Courtney Bay improvements, and another dry dock. Quebec has under way large docks and dredging contracts, while at Levis the biggest dry dock in the world is under way. The St. Lawrence channel is being deepened to Montreal, where the port improvements scheme, when completed, will have cost eighteen million dollars.

Toronto harbor works will entail another ten million. At Hamilton, Sault Ste. Marie, Port Arthur, and Fort William similar undertakings are well advanced. Winnipeg is getting navigation by the Red River. On the coast, the Vancouver docks will cost upwards of six millions.

In addition to the Victoria harbor works, the site is selected for a dry dock to duplicate that at Quebec.

CONCERNING LEATHER BELTS.

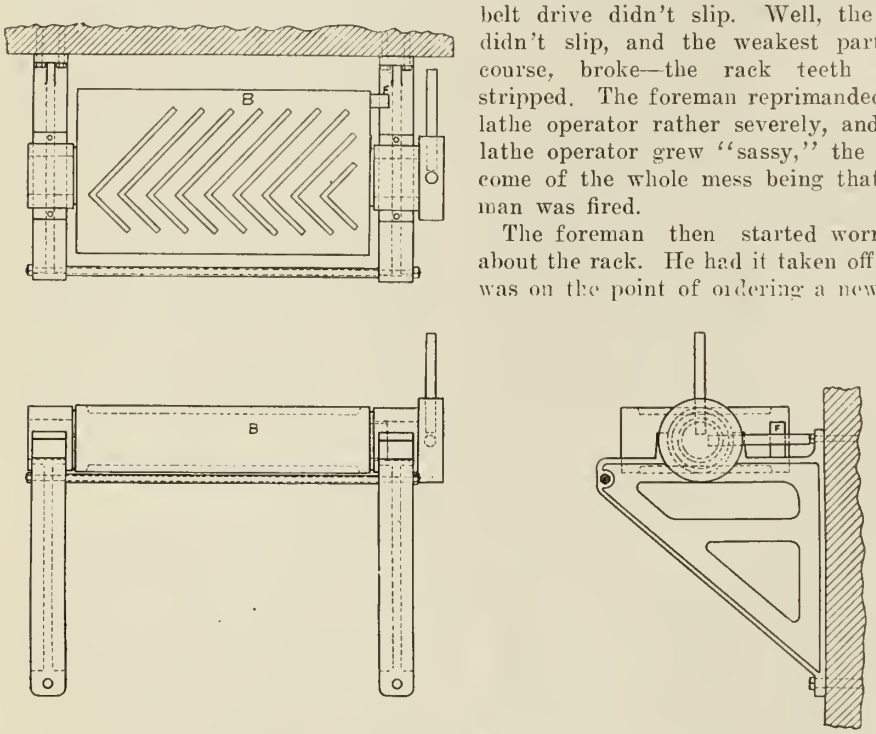
LEATHER belts, states the Light Car and Cyclecar, differ from the rubber kind inasmuch as they require some form of dressing in order to keep them soft and pliable. Seeing that belts on motor vehicles are almost invariably completely exposed to the attacks of the elements, a leather belt is more troublesome than a rubber one, as it is more affected by such attacks. Mud and gritty particles become embedded in leather, but rubber seems to repel matter of this kind, probably because it is more elastic. A leather belt should be periodically scraped on its driving side, and the best way to know when this operation is required is to examine the belt. If it shows signs of becoming glazed on the driving side it should be scraped with an old knife. Care should be taken to use the knife sparingly so as not to remove anything more than the grit. The belt should then be dressed, with oil.

BERLIN BOARD OF TRADE.

THE annual meeting of the Berlin Board of Trade was held on January 8, there being a large representative attendance. President Breithaupt, in his annual report, stated that Berlin's growth during 1913 was most gratifying. Three new industries were secured, which will employ at least five hundred hands. While the year has been marked by money stringency, there has not been a single failure reported in Berlin. He predicted that the city would reach a population of twenty thousand during 1914. Secretary Clement reported a membership of 270, being an increase of 20. Steps were taken to urge the City Council to appoint an industrial commissioner, and also to petition the Railway Commission to order the G.T.R. to move its shunting-yards to another section of the city.

The officers elected were—President, L. J. Breithaupt; vice-president, W. M. O. Lochead; secretary, W. P. Clement; treasurer, W. A. Schmalz. Council—H. J. Sims, D. B. Detweiler, Dr. Rudell, G. M. Sherk, W. H. Leesson, W. G. Cleghorn, A. Foster, Sr., W. E. Gallagher, H. L. Jansen, Dr. Walters, E. W. Lamprey, N. B. Detweiler, G. M. Debus, S. Wellheiser, E. Smyth.

Montreal, Que. — The warehouse of Frothingham & Workman, hardware merchants, St. Paul street, Montreal, was totally gutted by fire on Jan. 13. The firm's books and papers were saved, but the damage done to stock was $200.000, all of which is covered by insurance.



MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

A GAGGER MOLD.

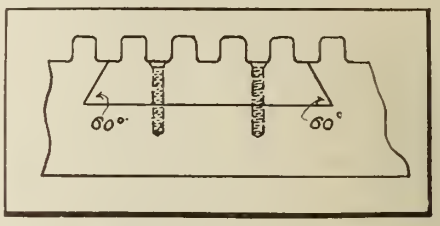
By D. O. Barrett.

MAKING gaggers is in most foundries a troublesome operation and is put off by the molder as long as possible, he meanwhile helping himself to his neighbor's stock. The mold shown in the drawings was arranged in a large foundry near the cupola, and bolted to the wall. It consisted of a large solid, cast-iron block (B) planed both sides to facilitate levelling and with a bearing turned on each end. The block was arranged for gaggers on one side, and for certain sizes of arbors on the other, large numbers of which were used in making cylinder cores. The bearings were slightly off centre so that the weight would come on that side and cause the block to always remain in a horizontal position resting on the foot (F) which, in turn, rested on the top of the supporting bracket. Two brackets supported

A GAGGER MOULD.

the block and were bolted solidly to the wall, being spaced at the outer end by the piece of pipe with a tie rod through same.

Two molders worked the arrangement, one pouring and one turning the mold. As fast as one side was filled, the block was turned over by means of the cold rolled steel handles in the collar at the end of one of the bearings. The foot (F) striking the bracket would jar out any of the castings which had a tendency to remain in the mold. When that side was full, it was again reversed. The pouring operation was almost continuous while it lasted, and, needless to say, it did not take long to make up a stock.



The block could be watercooled, but this was not necessary as it took a long time for the block to become hot enough to be objectionable. This was the main reason for making the block so heavy. After being used for some months no warping was detected.

MENDING A LATHE RACK.

By N. G. Near.

NOT many years ago when employed in a machine shop out West, one of the men very carelessly threw in the screw cutting clutch and feed screw simultaneously. You know just about what would happen provided the feed belt drive didn't slip. Well, the belt didn't slip, and the weakest part, of course, broke—the rack teeth were stripped. The foreman reprimanded the lathe operator rather severely, and the lathe operator grew "sassy," the outcome of the whole mess being that the man was fired.

The foreman then started worrying about the rack. He had it taken off, and was on the point of ordering a new one when I chanced to ask him if it wouldn't be possible to repair it at less expense than to buy a new one. He doubted it, but told me to go ahead and see what I could do with it. In less than an hour I had a block dovetailed into the rack as shown, most of the work being done with grindsones and files. The 60-degree angles were obtained by use of triangular files. I then laid off the teeth as accurately as I could with a scratch awl, took the block out, and filed the teeth to a very carefully made template. Two screws, as shown, made the job complete, but these were scarcely necessary inasmuch as they did not have to withstand any thrust when the lathe was

MENDING A LATHE RACK.

in use, and inasmuch as my fit was pretty tight anyway. I just put them in as a matter of safety.

It is true that the teeth I filed were not as accurate as the others that had been cut by cutters made for the purpose, still, the rack is still in service and doing good work. As far as I can see it is not absolutely essential that the teeth in a rack like this be perfect except for the sake of lessening the tendency to wear.

The foreman was much pleased with my effort because the lathe was laid up only a couple of hours, whereas, had he ordered a new rack, it would have been laid up for some days.

MAKING GAS ENGINE CAMS.

By D. S. Mann.

MANY gas engine builders make their cams either from steel castings or from drop forgings, finishing same all over by milling or grinding. Many cams are cast very close to size, and then disk ground to get the edge square with the face. In automobile practice, the cams and shafts are drop forged integral with each other, and, after being turned and milled, are hardened and then ground to size. These refinements are, however, not necessary in the ordinary farm engine, and the writer wishes to give two methods of making cams for this style of engine. Where cams are fitted to shafts by means of keys, very careful fitting is necessary as the pressure comes first on the one side and then the other, and, should the least looseness occur, the keys are gradually pounded out of shape and the cam comes loose. For this reason, cams are usually pinned as well as keyed where this method is employed. Fig. 1 shows a detail drawing of a cast iron cam and its shaft for a small gaso-

line engine of 1½ horse power. The cam is cast directly on the shaft, a one-quarter inch pin being driven in on the one side to act as a driving key. As the

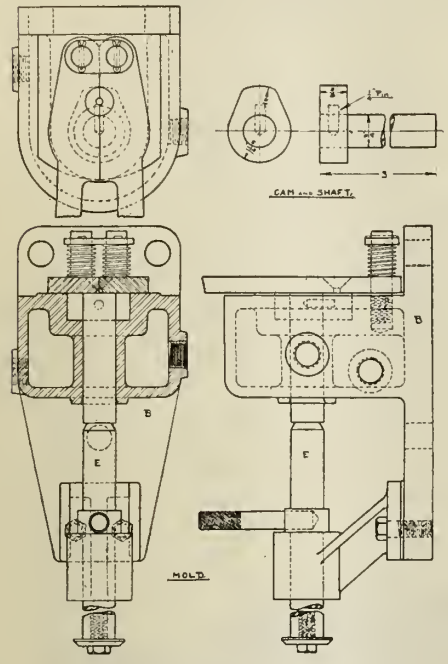


FIG. 1. MAKING GAS ENGINE CAMS.

metal contracts in cooling, it will grip the shaft.

The mold in which these cams are cast is shown in the three views. The body, (B), is a steel casting, being ma-

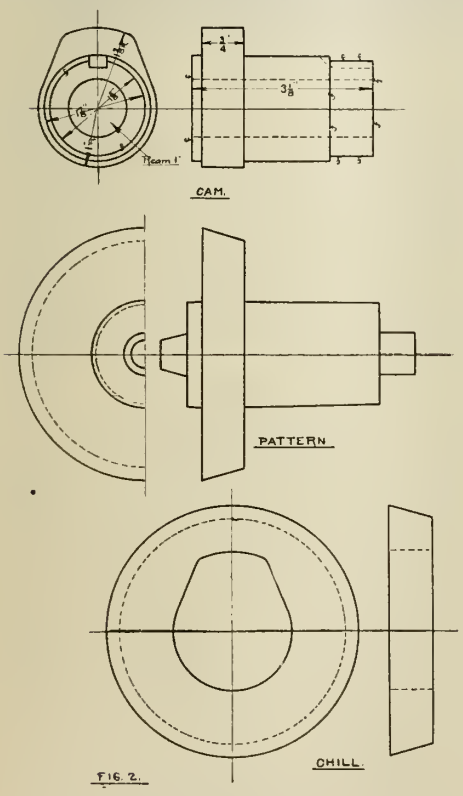

FIG. 2. MAKING GAS ENGINE CAMS.

chined out at the upper face to the shape of the cam. A cam shaft is shown in position in the mold, resting on the ejector (E). The body is cored out so that water may be circulated through to aid in keeping cool. Two steel plates are arranged to close over the top of the mold and are extended out to form handles, a clevis being riveted to the one handle, and, by slipping over the other handle, they are held together while pouring. A hole is provided over the mold for a pouring gate. The pivot pins have heavy springs to force down these plates and keep them in proper contact with the top of the mold. At the lower end of the main casting is a bracket carrying the ejector rod (E) which is in line with the cam shaft. This rod is provided with a knurled handle so that it may be raised up, thereby knocking out the cam and shaft. A washer is fastened to the lower end to limit its movement. A shoulder on the rod (E) rests on the top of the lower bearing, and the rod is of such a length that the cam shaft when dropped in comes just flush with the top of the mold.

The mold was bolted to the wall of the foundry near the cupola and piped for the running water. It was operated by two men, one doing the pouring and the other dropping in the shafts and ejecting the castings. The inside of the mold was kept well coated with graphite. The iron set very quickly, and the cams could be knocked out almost immediately after pouring. No further work was done on the castings with the exception of grinding off the gate.

In Fig. 2 is shown a cam of a different type, this one revolving on a stationary shaft. The cam is cast with a hub on either side, the long hub being turned down on the end to receive the driving gear. The other end is merely faced off after the hole is reamed. The pattern is fitted with a print as shown, and when lifted out of the sand, the chill is dropped in. It is seen that the cam is only chilled on its working edge. The cams come out of the chills exceedingly smooth and no grinding is necessary except perhaps to take off a fin at the edges. The cams remain in the chills until the molds are knocked out, but, while the edge of the cam is exceedingly hard, the rest of the casting is not affected. These cams come true to the desired shape and size, and any style of cam can be readily made from its corresponding chill. The cams shrink slightly so that they drop out of the chills without trouble. This is one of the best and cheapest cams for gas engine purposes.

IMPROVING OPERATING CONDITIONS.

By P. W. Blair.

THE President of a brass manufacturing plant in a central western Canadian city who makes two trips a week over his entire plant noticed on one of his trips that two new and inexperienced girl coremakers were working at one of the core-benches. He stood for a few minutes watching them at work making cores, and noted that although they were doing their best they were making but little progress. Calling the foreman, he enquired as to the absence of the experienced girls who previously occupied that core bench. The foreman informed him that he could not keep them during the hot weather. "In summer time, they get lazy I guess," said the foreman.

The president, who had grasped the situation, replied "well I would get lazy too, if working in a place like this. I will send the electrician down here at once to put in electric fans wherever they are needed, after which we will put in skylights. When this is done you make it a point to get word to the girls who have quit that the core-room has been made more comfortable, also get the same word to any exceptionally good workers who have been here and see if we can't get them back. This time of the year is our rush season, and we can't afford our experienced coremakers to lay off."

The improved arrangements brought back some of the experienced girls at once, and since that time there has been much less "laying off" on hot days. The management has found the fans a good investment, and many other manufacturers can learn a lesson from the above experience by looking after the sanitary conditions and welfare of the employees.

NOVA SCOTIA STEEL & COAL CO.

MR. R. E. HARRIS, K.C., president of the Nova Scotia Steel & Coal Co., who, with Mr. Thomas Cantley, vice-president and general manager, visited recently the company's works at Sydney Mines, on being asked as to the truth of the rumor that the company contemplated the closing down of the collieries and furnaces for several months, said:

"There is a very general depression to-day in business throughout Canada. We are feeling this depression in common with other industries. We now have a considerable accumulation of pig iron, which it is not desirable to further increase. Our blast furnace department may close down for some weeks. The output of coke and steel will also probably be somewhat reduced, pending the return of normal conditions.

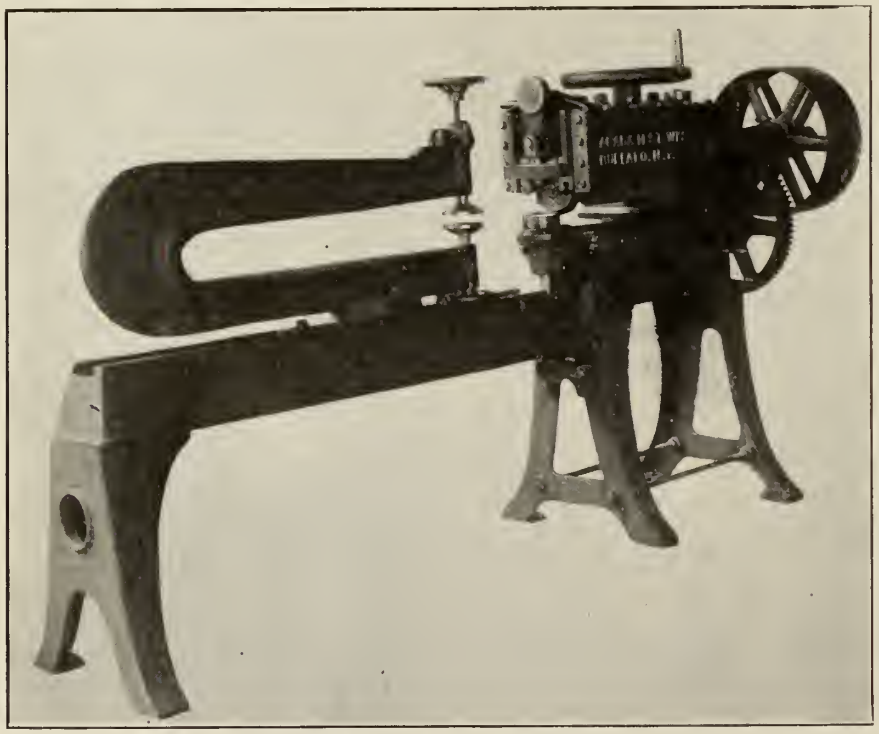
"We may be forced to reduce the number of employes at the collieries, but we hope by practising rigid economy to be able to keep them all working throughout the winter. Every effort will be made by the management of every department to keep the hitherto steady workmen employed. I do not think the present depression will be of long duration."

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

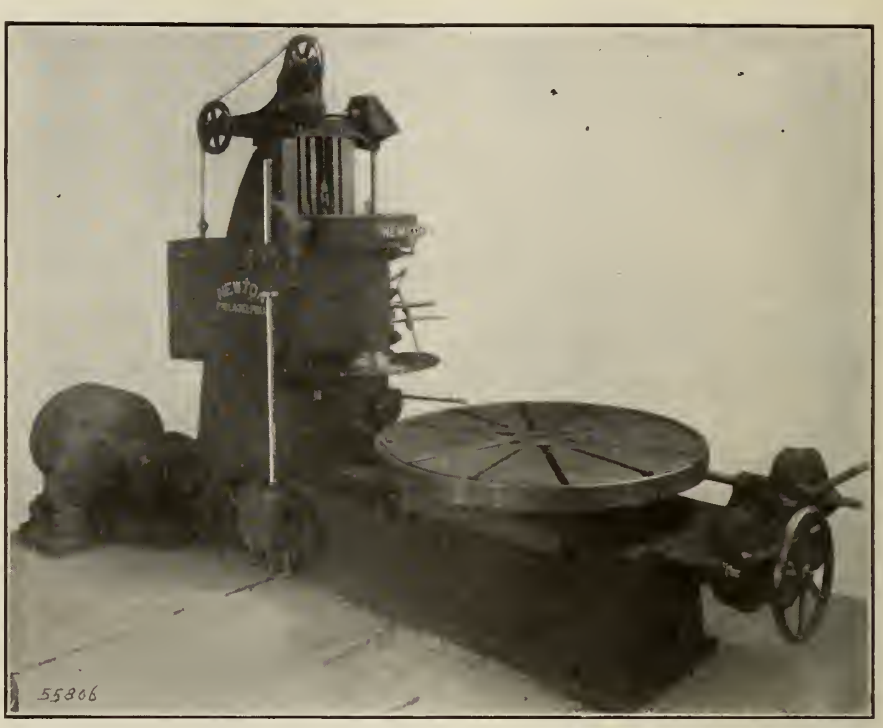
NIAGARA BOTTOM FLANGING MACHINE.

A NEW bottom flanging machine designed and built by the Niagara Machine & Tool Works, Buffalo, N.Y., is shown in the accompanying half-tone. The machine is intended for the manufacture of heads and bottoms for barrels, tanks, steel vessels, boilers, etc., and should prove particularly useful where it is required to produce heads of various diameters, as it would prove practically prohibitive to do the work on presses and dies, especially when the requirements were limited.



Besides forming flanges, different shapes can be produced by substituting suitable shaped forming rolls. The machine can also be used as a circle and slitting shear, in which case, the flanging rolls have to be removed and replaced by cutters.

The machine is single back-geared and is provided with fast and loose pulleys. The main gear is mounted on the lower shaft while the upper shaft is driven from the lower one by means of the compensating connecting gear. The upper shaft can be raised and lowered, while always retaining its horizontal position by means of screws, strippers, gears and hand wheel, mounted on top of machine.



To prevent the metal from being distorted during the flanging operation, two hold down rolls, mounted on the slide in front of upper flanged rolls can be quickly raised and lowered by means of an eccentric lever.

The lower flanged roll is mounted on a vertical shaft. The latter being driven from the main shaft of bevel gears. The upper shaft can be adjusted laterally to allow for metal of different thicknesses. For this purpose, an eccentric segment lever is located at the front side of machine within easy reach of the operator.

The machine will flange discs from 14 in. to 60 in. diameter of No. 10 gauge metal, the maximum height of flange being 1½ inches.

BOTTOM FLANGING MACHINE.

NEW DESIGN COLD METAL SAWING MACHINE.

NEW DESIGN COLD METAL SAWING MACHINE.

THE accompanying illustration shows the first of a new design of Cold Metal Sawing Machine having a vertical spindle with a blade in horizontal position for cutting off risers from flat circular castings, such as, engine driving wheels, large spur gears, propeller blades, etc. This particular machine was furnished to the United States Government by the Newton Machine Tool Works, Philadelphia, Pa., to operate largely on mountings for rapid fire guns, which have a large number of sink heads, and it is figured that there will be a saving of at least twenty out of the twenty-five

hours formerly necessary for this particular job.

The machine is equipped with a Taylor-Newbold new design inserted tooth blade 30 inches in diameter and having temperate steel body. The capacity for round stock in one cut is 8½ in.; diameter of circular table over all 60 in.; minimum distance centre of blade to top of table 1 in.; maximum distance blade to table 24 in.; distance centre of spindle to frame 15 in.; in and out adjustment to table sufficient to swing 72 in. diameters in front of a 30 in. blade.

The machine is driven by a General Electric, RLC, 116, 10 h.p. semi-enclosed motor, running at 600 to 1,200 r.p.m., complete with drum controller. The spindle is driven by a large diameter worm wheel having a bronze ring with teeth of steep lead, and a hardened steel worm fitted with roller thrust bearings, so arranged that thrust of both is taken by a common casting, and both the worm and worm wheel revolve continually in a bath of oil.

The spindle saddle is counterweighted, has reversing, vertical fast power traverse in addition to hand adjustment with provision for locking securely at any desired height. Side adjustment of the saddle on the frame is made by means of taper shoes. Motion for the drive and all movements from the motor are transmitted through spur and bevel gears to the vertical driving spline shaft, and also through the double train of bevel gears engaged by the Carlyle-Johnson friction clutch, controlling the feed and fast power motion. This transmission is clearly shown in the illustration.

On the opposite side of the machine, the motion is transmitted through a box having eight gears, giving six changes of circular and longitudinal feed, both of which are independently clutched as shown in front of photograph. The work table has end slots, and the lubricant is carried through the centre of the table, saddle and base to a reservoir in the base for re-distribution by means of a gear pump. In addition to the gear feeds to the circular table, reversing fast power traverse and reversing longitudinal fast power traverse in addition to hand control are available. The machine occupies a floor space of 12 ft. x 5 ft., and weighs 20,000 pounds complete.

During the preliminary test on the builders' erecting floor without foundations, the following data was secured;

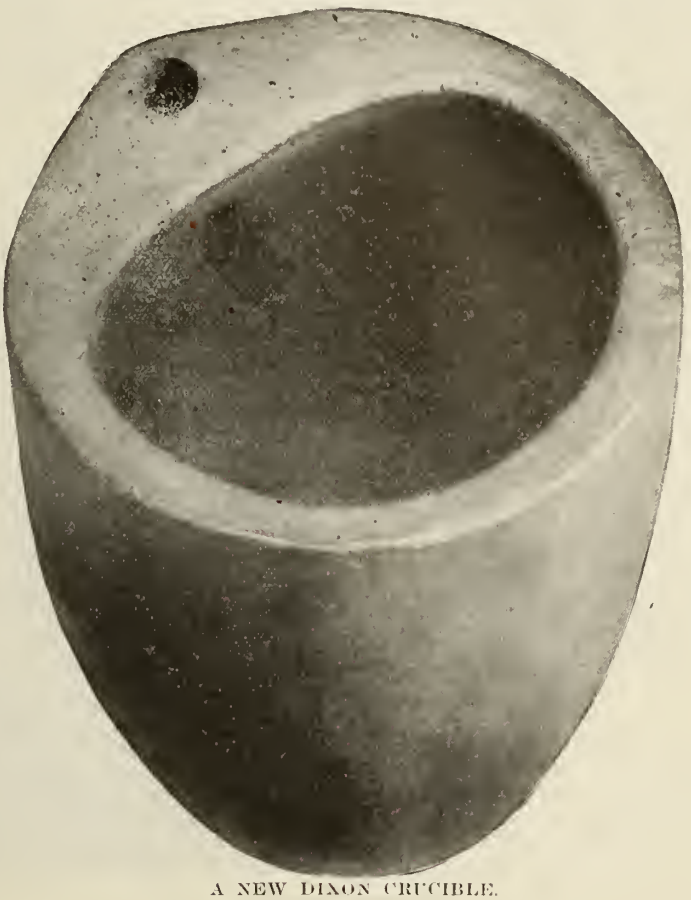
With the machine running light, blade rotating a 65 periphery feed per minute, the motor took 6 amperes, and the following operations to test the feed on 5 in. diameter, 35 carbon stock, were made.

Circular feeds No. 3, 6 min. 15 sec. per cut, 24 amperes, 228 volts.

Circular feeds No. 5, 3 min. 20 sec. per cut, 28 amperes, 228 volts.

Circular feeds No. 4, 5 min. 30 se

Circular feeds No. 6, 2 min. 10 sec. per cut, 36 amperes, 228 volts.



Straight feeds No. 4, 5 min. 30 sec. per cut, 24 amperes, 228 volts.

Straight feeds No. 6, 2 min. 45 sec. per cut, 34 amperes, 228 volts.

In addition to these, a number of other cuts were taken with the blade in good condition. It should further be understood, that any of these feeds could be used on the circular, as well as the longitudinal directions. It was found that the blade on this machine rotated more smoothly than even the horizontal types, which are the maker's standards, and as the present average feeds in steel foundries range from ⅝ in. to ¾ in. per minute, it will be realized that this machine which easily cuts 2½ in. per minute is destined to make new records in steel foundry practice.

A NEW DIXON CRUCIBLE.

THE illustration shows a new crucible which has been evolved by Henry Weisbrodt, an employe of the Joseph Dixon Crucible Co., to be used by melters of precious metals. It has been designed to do away with skimming, and also to prevent the possible chance of charcoal or molten fluxes getting into the ingot or casting. This crucible has a bridge at the top, which, on pouring the metal, holds back the charcoal and foreign matter, and so delivers clean metal. The new design does not in any way reduce the holding capacity of the crucible, and the metal can be stirred as satisfactorily as in a regular crucible.

A NEW DIXON CRUCIBLE.

Montreal, Que.—On January 13, fire did damage to the plant of the Canadian Tube & Iron Co., Ltd. The blaze originated in the roof of the boiler house which was seriously damaged as were also the electrical department, and the nut and bolt shop. The loss is estimated at about $15,000 and is covered by insurance.

The Dominion Iron & Steel Co., Sydney, N.S., has received a five thousand ton rail order from the Australian Government. This is the first of a series of orders which the Southern colony will give the Sydney plant. The rail mill is finishing a large order for the Canadian Northern, following which the mill will be off ten days for repairs. After the Australian order is finished, a big order for the C.P.R. will be rolled, and later a 12,000 ton order of sixtys for a western firm. The bar mill is manufacturing some 15,000 tons of reinforced concrete rods for the Welland canal. The plant is running full blast with normal pay roll.

INDUSTRIAL NOTABILITIES--No. 18

ILL-HEALTH or accident often changes the course of a man's life, and makes him a millionaire, whereas his forsaken profession would have narrowed him down in a small town. Particularly is this true in politics. Some of Canada's premiers have been plucked from editorial desks in obscure towns, or have put aside their lawyer's gowns. The subject of our sketch was never a prime minister, but for years has been a premier among Canadian manufacturers. Cyrus Albert Birge is mainly interested in such things as tacks, screws, and agricultural implements. When a young man, his thoughts were centred on sore stomachs, pneumonia, appendicitis, and things like that. His ambition was to become a doctor, but he needed a physician himself. Regretfully he abandoned his studies after matriculating at Victoria College of Medicine, Toronto.

There is as big a contrast between tin tacks and pills and peaches, but Cyrus H. Birge, in his younger days, seems to have been a man who could turn his hand to anything that would produce money. Thus, after abandoning medicine, he went into the grocery business for himself at Stratford. After two years he sold out, and started another store at Chatham, Ont.

His next move was as an accountant with the Great Western Railway of Canada (now part of the Grand Trunk), where he remained for ten years in the engineering depart-

CYRUS ALBERT BIRGE.

ment. In 1882 he resigned, and took the position of manager of the Canada Screw Co. In 1883 he was made its general manager and vice-president, and in 1898 bought the entire business from the American Screw Co., of Providence, R.I. He re-organized the Canada Screw Co., and became its president. In 1906 Mr. Birge amalgamated the Ontario Tack Co. with the Canada Screw Co., under the latter name, and in 1910 this was merged with the Steel Company of Canada, composed of the Canada Screw Co., Hamilton Steel & Iron Co., Montreal Rolling Mills, Dominion Wire & Manufacturing Co., of Montreal, and the Canada Bolt & Nut Co. Mr. Birge is vice-president of the Steel Company of Canada, vice-president of the Hamilton Stove & Heater Co., director in the Sawyer-Massey Co., of Hamilton, director in the Bank of Hamilton, vice-president of the Mercantile Trust Co., of Hamilton, president of the Sovereign Fire Insurance Co., director British American Oil Company and many others.

Mr. Birge was born at Oakville, Ont., November 7, 1847. In his married life he has been most unfortunate. He has lost two wives by death. In 1908 he married his third wife. There are several children living. His residence is in Hamilton, Ont.

Mr. Birge is a member of the Hamilton Club, National Club, Toronto, Caledon Mountain Trout Club, Hamilton Golf Club, the A.O.U.W., and is an Oddfellow. He has been vice-president of the Hamilton Board of Trade, and also of the Canadian Manufacturers' Association.

TEACHING AUTOGENOUS WELDING.

AUTOGENOUS welding, which only a few years ago was looked upon as a novelty of somewhat doubtful value, has now become an almost indispensable adjunct to many industries. The oxy-acetylene and oxy-hydrogen torch, both for welding and cutting, is now recognized as a very great labor-saving device, and is becoming widely used in the metal-working trades, not only for repair work, but also for manufacturing purposes.

In autogenous welding, it is universally admitted that the reliability of the results attained are very largely dependent on the skill of the operator, and this will probably always be the case. In small plants, where the process is only occasionally employed to effect repairs to some badly needed forging or casting, it has been usual to call in an expert employed by some firm making a specialty of this class of work, and even in our large railway shops, where the process may be in practically continuous use, it is not uncommon to find only one or two men, among the many hundreds employed, who know anything about it.

This has perhaps been unavoidable hitherto, as most of the operators have picked up their welding knowledge in the shop where they were employed, and while these have for the most part become experts, when they leave the shop or are promoted to some higher position, it is hard to replace them, an inexperienced man having usually to be broken in "ab initio" to fill the vacancy. It is, therefore, interesting to note that the Montreal Technical School, recognizing the local demand for skilled welders, are conducting a weekly evening class in autogenous welding at which practical and theoretical instruction in the art is being given by experts. Each lesson lasts two hours, and there are ten lessons in the course.

While it is not suggested that a student can become an expert welder after only twenty hours' instruction, much can be done in that time to impart a good grounding in the subject, and to stimulate a desire for further knowledge of the work. Several men who are employed at this work during the day are attending the class, which is an extremely encouraging sign, for it were safe to say that the majority of operators are not familiar with the theoretical side of the subject, though they may be able to obtain very fair results in practice.

The present is the second winter that this course has been conducted. Last year it met with great success, and many old students are now taking a second-year course. This move on the part of the management of the Montreal Technical School is to be heartily commended, and we wish the class continued success. It is hoped in the near future to give instruction in this subject to day students also, the difficulty hitherto having been to secure the services of practical demonstrators during the day time.

Autogenous welding, in addition to filling an important niche in mechanical engineering work generally, becomes, in the case of factory operation, of inestimable value in preventing shut-downs of long duration. Expensive repairs to broken or fractured parts of the equipment, and even the necessity of replacement by entirely new pieces, have been and are being offset by the successful application of the process. It is incumbent, therefore, that master mechanics in factories, and particularly those directly responsible for advice concerning the carrying out of repairs, should be conversant with what is being accomplished in the direction of saving valuable equipment, which disaster may have overtaken, and of being able to discern when it is possible to have the work done, to all intents and purposes without removal from the plant. The progress of autogenous welding has been marked by rapidity and success due to merit, and it is our belief that near future development will increase its value even more so than in the past.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON.

	Montreal.	Toronto.

Best Slack	3.05

All net ton f.o.b., Toronto.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Jan. 19, 1914.—This month is always one that is largely taken up with making inventories, stock-taking, etc., so that trade is seldom very brisk during the first few weeks of the year; but while most lines are still quiet, and it is difficult to point to any branch of trade showing a marked improvement this week, the general tendency is slightly better. Collections, however, are still far from good.

Machinery brokers are not worrying much; in fact, they are quite optimistic. A leading house said this morning that prospects were a good deal brighter than they were a month ago. The railways are once more beginning to show some interest in the prices of machinery, and some fair enquiries have been received, though no specifications have as yet been issued.

The plant of the Canadian Tube and Iron Co., Ltd., was damaged by fire last week. The roof of the boiler house was destroyed, and damage was also done to the nut and bolt department, which was put out of commission. This section, however, will be in operation again in the course of four or five days, according to a statement issued by the firm. The wrought iron pipe department was not affected.

The warehouse of Frothingham & Workman also suffered from fire on the same day, the building being completely gutted. The loss is estimated at $200,000, all of which is covered by insurance.

Metals.

The metal market remains dull. A little business is being done in pig iron, but consumption continues to be of the "hand-to-mouth" order, and enquiries for spring supplies are not yet being made.

With regard to the steel market, recent press reports from Pittsburgh stating that large orders had been received appear to have been greatly exaggerated. Probably no great improvement need be looked for before the first or second week in February.

Toronto, Ont., Jan. 20, 1914.—The price of wire in the United States has advanced a dollar per ton, but Canadian manufacturers have left their price unchanged, and are taking advantage of the increase across the line. Since the latter occurred, the wire business in Canada has been exceptionally good.

Business in steel bars has not improved greatly at the Canadian mills. All consumers are specifying more, and, as they have allowed their stocks to get low, and realize that the price of bars is as low as it will go, quite a number are buying, or are about to buy. There has also been some good business done in pig iron during the past few days; in fact, the most marked jump in business this week is in pig iron. Manufacturers, however, are not disposed to say much.

Business in nails is only fair. The price dropped last week for steel wire nails, base, from $2.30 to $2.15. The prices of cut nails and spikes remain the same. This is not the first reduction in the price of nails in Canada since last summer. Another reduction is in iron rivets, the discount on which is now 60, 10 and 10, an increase of 10 per cent. It will be noticed that the discount on iron pipe fittings have undergone an appreciable change.

Machine Tools.

There has been a marked improvement in the machine tool market since the first of the year, though the improvement is more in inquiries than in actual business. One of the chief inquiries comes from the Hamilton Bridge Co., who are increasing their equipment by the addition of lathes, radial drills, planers, milling machines. The inquiries are usually from new concerns, and are for new machines. There is a marked tendency, however, owing to the tightness of money, for purchasers to offer old machine tools in part payment for new ones. This is being done quite a lot in the United States to secure business.

British Machine Tools.

There has been considerable discussion lately regarding the difficulty of the British manufacturer securing a hold in Canada in competition with Canadian and American concerns. A case this week showed why there is this difficulty. A local concern have an English planer, which they like. They wanted another like it, quickly. A cable was sent. The reply stated that delivery would take place in six weeks, which means that it will be ten to twelve weeks before it gets here. Then, when it arrives, it is knocked down, and requires to be assembled.

Canadian customers will not wait all this while for delivery. British machine tool makers have been enjoying remarkable prosperity lately, but it is not long since the above planer was kept in stock, and could be shipped immediately. There are lots of machines to be picked up in England, but they are not what are marketable in Canada. Dealers often find it safer and cheaper to quote on Canadian and American machines unless the customer has a distinct preference for British tools. A local firm placed an order for tools with a British firm, and, after a year and a half, the goods not having been delivered, the order was cancelled.

The Hendee Mfg. Co., Toronto, branch of the Springfield, Mass., makers of the Indian motor-cycle, who have an assembling plant here, have added a milling machine to their equipment. The manager announces that if business increases at the present rate, it will be necessary to erect a branch plant here.

Metals.

It will be noticed that the price of aluminum is lower this week. We are informed that the market for this metal is dull, and that there is little demand for it just now. The metal business generally is quiet. Little scrap is being sold. Copper is cheaper. People are just buying to fill immediate requirements.

INDUSTRIAL NOVA SCOTIA.

AN effort has been successfully carried out to demonstrate to the world the progress that Nova Scotia has made in the field of manufacturing. We refer to a book entitled, "The Industrial Ascendancy of Nova Scotia," which has recently been published by the Nova Scotia Branch of the Canadian Manufacturers' Association. This volume is a picture story of the principal manufactories in Nova Scotia, and will, we are sure, prove an eye-opener to many with respect to the industrial development that has taken place in Nova Scotia, and particularly in such centres as Amherst, New Glasgow and Sydney. An impression exists in some quarters that Nova Scotia is not a manufacturing Province, but such an impression will certainly be dissipated by a perusal of this finely-illustrated publication.

The contest for business to-day is as strenuous between countries as it is between individuals, and the same qualities that count for the success of the individual in the competitive field count equally for the success of a Province or Nation. The more a man becomes known for efficiency in what he is attempting to do, the more business is likely to come his way. Consequently, as Nova Scotia becomes recognized more widely as a place where manufacturing can be carried on successfully, the confidence of outsiders will be correspondingly enlarged. Wherever this booklet goes it will be an ocular demonstration of the progress that Nova Scotia has made in the creation of factories. Indeed, the volume is designed not only to change the opinion of those who think of Nova Scotia as merely a producer of fish, farm products, and lumber, but also to induce an interest among capitalists in the establishment of additional factories in that Province. Copies of the booklet may be obtained by writing the secretary of the Publicity Committee, Nova Scotia Branch, Halifax.

Personal

H. M. Morrow of the motor truck department of the Canadian Fairbanks-Morse Co., Toronto, has been transferred to the Vancouver branch.

H. B. Taylor, M. Am. Society M.E., gave a paper on the design and construction of hydraulic turbines at the meeting of the Montreal branch of the Canadian Society of Civil Engineers on Thursday last, Jan. 15.

A. M. Moseley, manager of the Page-Hersey Pipe Mills, Welland, who is leaving to take charge of the company's new plant at Fort William, was presented by members of the Welland Club on Monday last with a decanter, silver tray, and a dozen cut glass tumblers. L. B. Spencer, president of the club, made the presentation.

New Incorporations

Woodworkers, Ltd., incorporated at Toronto, capital $40,000, to manufacture wooden articles at Toronto. Incorporators: Louis F. Strickland, Alexander B. Beverly, etc., Berlin.

Taylor Portable Steel Derrick, Ltd., incorporated at Toronto, capital $40,000, to manufacture, buy, sell and deal in derricks, machinery, tools and hardware of all kinds at Toronto. Incorporators: George M. Kelley, John D. Falconbridge, etc., Toronto.

The Maritime and Newfoundland Steamship Co. Ltd., incorporated at Ottawa, capital $150,000, to carry on a general shipping business, at Halifax, N.S. Incorporators: James G. Farquhar, Charles W. Rowlings, etc., Halifax.

Muskoka Lakes Supply Co., Ltd., incorporated at Toronto, capital $40,000, to engage in the business of boat building, plumbing and furnishing boat supplies and boat repairs, at Port Sandfield, Ont. Incorporators: Richard A. Shields, New York, Edwin Rogers, etc., Port Sandfield.

The Northern Electric Co. Ltd., incorporated at Ottawa, capital $10,000,000 to manufacture and deal in every kind of metal, machinery, apparatus and device, and the appurtenances of the same, at Montreal. Incorporators: Harry F. Sare, George R. Gray, etc., Montreal, Que.

The Canadian Hotpoint Electric Heating Co. Ltd., incorporated at Ottawa, capital $100,000, to carry on business as manufacturers, exporters and importers of electric heating, lighting and power appliances and devices, at Toronto. Incorporators: Earl Holmes Richardson, Percy H. Booth, Ontario, Cal.

Montreal, Que.—The Albion Motor Car Co. of Canada, Ltd., have been incorporated at Ottawa, capital $75,000, to manufacture all kinds of motor vehicles and other vehicles and conveyances, and all parts or accessories useful or necessary in connection therewith; the tools and machinery required for the manufacture and maintenance of same. Incorporators: Alexander H. Duff, Walter A. Merrill, etc., Montreal.

Cap de la Magdeleine, Que.—The Modern Foundry and Soil Pipe Co., Ltd., have been incorporated at Ottawa, capital $250,000, to acquire the business now carried on by the "Modern Joint of Montreal, Ltd.," and to carry on the business of general foundrymen, manufacturers of all kinds of pipes, machinists, smiths, patternmakers, and electricians. Incorporators: Louis Adolphe Payette, Joseph Galipeau, etc., Montreal.

Coaticook, Que.—A. O. Norton, Ltd., have been incorporated at Ottawa, capital $250,000, to acquire all the property belonging to A. O. Norton, incorporated, situated in Coaticook, Que., together with the business and good-will attached thereto, and to pay for the same either in cash or in shares of this company; to manufacture lifting jacks and all kinds of tools and machinery, supplies for railroads, steamships, mines and mills; and to do a general machine shop business. Incorporators: Arthur O. Norton, Mary H. Norton, etc., Hatley, Que.

Catalogues

The Herbert Morris Crane & Hoist Co., Ltd., Peter Street, Toronto, have issued a bulletin, A-11, dealing with the Morris triple-gear chain blocks. The illustrations include views of the component parts of a chain block and also one in operation. Copies may be had by writing the company.

The Jeffrey Mfg. Co., Columbus, Ohio., have issued recently a new bulletin, No. 63-A, containing price lists of the "Jeffrey" detachable link chain attachments and wheels. The many types of links and attachments made by this company are fully illustrated and tables included give the principal dimensions in addition to the prices. Copies of this bulletin may be obtained from the company's office at Montreal, P.Q.

Gears and Rolling Mill Pinions is the title of Bulletin K which is being distributed by the Mesta Machine Co., Pittsburgh. Illustrations are given of large gears being machined, and also of some large pinions, while the reading matter deals with cut gears in a concise manner. The bulletin also contains some data on gears and diagrams of safe loads for mouded gears and pinions of cast steel.

The Casler Offset Boring Head is described fully in catalog "D" which we have received from Marvin & Casler Co., Canastota, N.Y. The application of the "Casler" head is dealt with fully, together with several illustrations showing it mounted on turret lathes, milling machines and drill presses. The catalog also contains a number of tables and specifications giving the principal dimensions of each size of head and also of the boring bars that fit in the head. Copies will be sent to interested readers.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

St. Thomas, Ont.—The new locomotive shops of the Michigan Central Railway are nearly completed.

St. Catharines, Ont. — Steel and Radiation, Ltd., resumed operations last week with a full staff.

Preston, Ont.—Clare Bros. & Co., manufacturers of stoves, etc., are in the market for a radial drill.

Woodstock, Ont.—The town is erecting a manual training school for which machinery is being purchased.

St. Thomas, Ont.—Important changes are contemplated by the Board of Education in connection with the manual training school.

St. John, N.B.—T. McAvity & Sons, Ltd., advise that it will be some time before they are in the market for equipment for their new plant.

Pembroke, Ont.—The ratepayers have voted favorably on a by-law to give a site costing $5,000 to the Harwood Specialties Co., who will erect a plant here.

Hamilton, Ont.—The Hamilton Bridge Co. is in the market for a large number of machine tools, consisting of lathes, radial drills, planers, milling machines, etc.

Rock Island, Que.—The plant of the Union Twist Drill Co. will be erected here, which is just across from Derby Line, Vt. It will be used by Butterfield & Co.

Dundas, Ont. — The Canada Crushed Stone Corporation who suffered a loss of about $20,000 on Friday, Jan. 9, by a fire which destroyed their plant, will rebuild.

Trenton, N.S.—The Eastern Car Co., who use the product of the Nova Scotia Steel and Coal Co., are running at full capacity, and extensions will be made to the plant this year.

Medicine Hat, Alta. — The International Supply Co. will manufacture a new line this year. They will make a gas engine, principally for the Western trade. W. R. Martin is manager.

Vancouver, B.C.—M. A. Ryan, Superior, Wis., has written to the Progress Club expressing a desire to establish a boiler works in this city. He is manager of a similar plant in Superior.

Southampton, Ont.—The ratepayers have passed a by-law granting the Steel Furniture and Fittings, Ltd., a free site for a new plant and exemption from taxation for ten years.

Galt, Ont.—The Galt Stove and Furnace Co. have offered part of their new addition to a new Ohio concern until they can erect a plant on a site in Jackson Park. The building will be a single-storey structure, 300 x 60 feet.

Brantford, Ont.—Goold-Shapley and Muir Co., who have just closed a splendid year, will manufacture a new oil engine, to use coal oil instead of gasoline. They are also putting out an improved windmill.

Woodstock, N. B.—Operations at the foundry of Connell Bros., Ltd., have been suspended for financial reasons. As the assets far exceed the liabilities, it is expected that this old-established concern will soon be running full again.

Grimsby, Ont.—The Canadian Steel Specialty Co. are installing machinery in their new plant, but are unable to complete the work owing to the large number of orders on hand. They recently received an order for a thousand opera chairs.

Redcliffe, Alta. — The Rolling Mills and Bolt Works commenced operations again on Monday, Jan. 5, after being closed throughout the holiday season. The company is now employing about 75 men, and expect to keep the plant running steadily throughout the year.

Welland, Ont.—The Michigan Central Railway will extend their line from Welland to Dain City. It is believed that this is to accommodate the Dain Company, and that the John Deere Plow Co. will proceed with the erection of their $2,000,000 plant in the Spring.

Sarnia, Ont.—The Reid Wrecking Co. of Sarnia will spend nearly $70,000 on their drydocks at Port Huron. A new steel structure equipped with the latest machinery and apparatus for ship repairing will be erected at a cost of about $45,000, and about $25,000 will be spent on a modern new pump house.

Vancouver, B.C.—The Vancouver Iron and Metal Co. will prepare plans for a new foundry, costing about $25,000.

Montreal, Que.—The Canadian Tube and Iron Co. plant was damaged by fire recently. The bolt and nut department was out of commission for a few days. The wrought pipe department was not injured.

Sydney, N.S.—The rail and blooming mills of the Dominion Iron and Steel Co., which have been running continuously for several years, closed down last week for repairs. This is to allow of the ingot heating furnace being installed and the machinery being overhauled.

Edmonton, Alta.—So that it might construct buildings in this city for the manufacture of its products, the Winnipeg Ceiling and Roofing Co. and Edmonton Metals, Ltd., through the president, M. J. McMartin, have purchased trackage property, comprising block 17, Cromdale, south and east of the G.T.P. tracks.

Hamilton, Ont.—Wm. H. Marsh, manager of the Standard Underground Cable Co. of Canada, announces that the capital of the company has been increased from $500,000 to $1,000,000, and that several important extensions will be made to the plant during this year, and that the staff would be considerably augmented.

Ottawa, Ont.—J. E. Ray, acting trade commissioner in Great Britain, reports that British manufacturers of motorcars will erect depots, consisting of garage, repair shop and assembling factories at several points from coast to coast, to develop later into branch factories. Subsidiary companies will be floated here, with Dominion charters.

Woodstock, Ont.—Since the ratepayers voted a bonus of $20,000 to the Concrete Machinery Co.—an amalgamation of the Mitchell Concrete Machinery Co., Toronto, and the Wind Motor Co., Woodstock—work on the new plant has been rushed, so that in a short time it will be ready for the machinery. Mr. Thomas Watson, manager of the Wind Motor Co. has been purchasing a few tools, but a total of $15,000 will be spent on equipment and additions to building. Among the equipment required will be an oxy-acetylene welding ap-

paratus. Road machinery, crushers, and tile and concrete machinery will be made. R. L. Mitchell, 75 Indian Grove Ave., Toronto, is interested.

Chatham, Ont.—The National Forging Co., organized in October to manufacture automobile and carriage forgings, are now in the market for a considerable quantity of machine tools. They will occupy the old plant of the Swift Motor Car Co., and are understood to be connected in some way with the Ford Motor Co. The company is capitalized at $100,000. Mr. Hess, Chatham, is interested, as well as several wealthy Americans.

Granby Bay, B.C.—Within five weeks the new $2,500,000 smelting plants of the Granby Smelting Co. will begin operations. The plant has been put in primarily to handle the output of the Hidden Creek copper mines, but ores from properties owned by other companies and individuals will be handled. The plant is intended to treat about 5,000 tons of ore a day, and is modern in every respect, including a hydro-electric power plant and machine shops.

Electrical

Kingston, Ont.—$27,000 will be spent for extensions to conduits.

Lynden, Ont.—Hydro-Electric engineers are preparing estimates for a line to Lynden.

Swift Current, Sask., is advertising for an electrical superintendent for its power house. Geo. D. Arnott, sec-treas.

Weston, Ont.—The Electric Light and Waterworks Commission will use the old power house as an auxiliary to the Hydro-Electric supply.

St. Catharines, Ont.—The Hydro-Electric Commission is looking for a permanent office and showroom.

Collingwood, Ont.—By-laws providing $55,000 for waterworks and electric light, $20,000 for the purpose of erecting a new town hall, both carried.

Goderich, Ont. — Several Goderich firms are buying electrical machinery in anticipation of Hydro-electric power being available.

Amherst, N.S.—The Canada Electric Co., of Amherst, N.S., have prepared plans for a 1,000 k.w. turbo-generator set for installation at Chignecto.

Ottawa, Ont.—It is understood that the Government has engineers preparing plans for the lighting of the Rideau Canal from Ottawa to Kingston by incandescent lamps.

Port Stanley, Ont.—The Governement will install a lighting system for the piers and warehouse here. Mr. Craig of the Public Works Department, Windsor, is securing necessary data.

Kincardine, Ont.—The Hydro-Electric commission engineers are investigating the water powers of Bruce, believing that the ultimate solution of the power difficulty will be some local development.

Brantford, Ont.—Brantford township has not yet given up attempts to secure Hydro-electric power. Efforts are being made to have street and domestic lighting in Parkdale, Echo Place and Grand View.

Havelock, Ont.—A Hydro-Electric consulting engineer has advised the town to purchase the electric light plant in the town rather than obtain power from an outside company and transmit it over a long distance.

Regina, Sask.—A motor generator and three turbo-generators are being installed; the former in the old power house, and the latter in a new building. The two 400 k.w. units in the old power house will be used as a standby.

Chilliwack, B.C.—The town will make a new contract for the lighting of the city with the British Columbia Electric Co. An entirely new system will be installed by the B. C. E. R., 100 c.p. Tungsten lights replacing the old 32 c.p. incandescent lights.

Gananoque, Ont. — The 1,000 horse power of electric energy from the plant at Kingston Mills, arranged for in the town's contract with J. M. Campbell, of Kingston, will be available for the use of local manufacturers early in the spring.

Halifax, N.S.—The Halifax Power Co., is understood to be planning to place hydro-electric current in Halifax next summer, generated at Indian River, fifteen miles from Halifax. The Company can only supply current for power purposes.

St. John's, Nfld.—Additional development of resources is expected from negotiations now under way by the Government for utilizing the large water powers of Labrador, and for establishing railway service between the east and the west coasts of the island with a ferry to the Canadian border.

Englehart, Ont.—The Charlton-Englehart Power Co. expect to have their plant in Charlton completed in about two months. Sutcliffe & Neelands of Liskeard, are building it. The steel flume, 7 ft. diam., is in place, and the wheel houses are nearing completion. The William Hamilton Co. of Peterboro, have the contract for the machinery.

London, Ont.—An addition to the hydro station in London, equal in area to the present building, is contemplated at the present time. The size will depend on the decision of Chief Engineer Gaby, of the Hydro-Electric Commission, as to whether the power for the London and Port Stanley Railway will be taken from the main station or from another building to be erected along the line, either in Chelsea Green or closer to the city limits.

Wood-Working

Fort William, Ont.—Construction work on J. P. Bertrand's new lumber mill started last week.

Granby, Que.—The drying kiln of the Myers Thomas Box Co. factory was destroyed by fire last week.

Green City, B.C. — George H. Green, Green City, near Salmo, B.C., contemplates the erection of a shingle mill in the spring.

Valley City, Alta.—The sawmill of the Valley City Lumber Co., recently destroyed by fire, will be rebuilt and considerable new machinery will be added.

New Westminster, B.C.— The Westminster Mill Co., is making plans for the erection of a refuse burner, dry kiln, drying and storage sheds, to cost about $12,000.

Fort Qu'Appelle, Sask. — The Fort Qu'Appelle Building and Woodworking Co., contemplate the erection of a planing mill in the near future at a cost of about $42,000.

Papineauville, Que.—The Papineauville Lumber Co. contemplate the erection of a mill for the manufacture of hardwood veneers for cooperage and cheese boxes.

Strathroy, Ont.—The town council have offered special inducements to the Canadian Handle Co., to rebuild its Strathroy factory, destroyed recently by fire.

Dryden, Ont.—The Dryden Timber and Power Co. will install a new evaporator. The general manager was in Chicago last week in connection with it.

Berlin, Ont.—The plans and specifications for a large and modern addition to the plant of the Interior Hardwood Co., on Wilmot street have been completed, and the work of construction will commence within the next few days.

Pembroke, Ont.—The sawmill department of the Shook Mills has resumed operations with about 40 additional men employed. This part of the factory was closed down for a month owing to inability to secure bolts because of the late arrival of the snow.

Lewiston, N.S.—The factory for making pegs and shanks was destroyed by fire on Jan. 13, throwing 100 men out of work. The machinery was destroyed, and the loss will amount to $50,000. The plant was three storeys high, and measured 620 x 40 feet.

Toronto, Ont.—The following plants were burned on Jan. 13, the damage totalling $80,000:—W. K. Rankin, excelsior packing; Parker Bros., wood turners; J. W. Woolnough, show-cases; Toronto Woodworking Co., novelty works; R. Lembke, cabinet works.

Antigonish, N.S.—The Colonial Lumber Co., a United States concern, have equipped a plant for the manufacture of hardwood flooring, veneering,, wainscotting, etc. They will commence operations in the early spring. The plant represents an investment of over $200,000. The factory is equipped with the finest of modern machinery, together with the latest constructions of kilns for drying the wood.

Building Notes

Toronto, Ont.—Horatio C. Boultbee will build a three-storey building at 63 and 65 Queen St.

Regina, Sask.—Campbell, Wilson & Strathdee will erect a five-storey warehouse at the corner of Dewdney and Cornwall Sts.

Toronto, Ont.—Holbrooks, Ltd., will erect a three-story brick and stone warehouse and office building on Foreign street, at a cost of $30,000.

Toronto, Ont.—A. Muirhead & Co. are preparing plans for the erection of a four-storey building on the corner of Frederick and King streets.

Montreal, Que.—Darling & Pearson, architects, Toronto have prepared plans for a seven-storey building for the Sun Life Assurance Co. The contractors are Messrs. Peter Lyall and Sons.

General Industrial

Lake Saskatoon, Alta.—F. N. Lawrence, of the Grande Prairie Milling Co., is purchasing new machinery to increase the capacity to 35 barrels per day.

Montreal, Que.—The Ceramo Art Glass Co. suffered a loss of $5,000 by a fire on January 12.

Caledonia, Ont. — The Haldimand Gypsum Co. contemplate the erection of a mill at the cost of $20,000.

Sauble Falls, Ont.—Messrs. M. D. Seaman & Son intend going into the manufacture of sand-lime brick.

Montreal, Que.—The mill and elevator of the Robinson-Oliver Grain Co., were destroyed by fire last week at a loss of $65,000.

Humboldt, Sask.—T. Ford and C. A. Chichester will open a steam laundry here, using electrically driven machinery.

Niagara Falls, Ont.—The Niagara Linen Co., Niagara Falls, N.Y., has purchased a site on Fourth Street, and propose erecting a $50,000 factory.

Quebec, Que.—The Provincial Government has appropriated $300,000 to build the road from Quebec to the Maine boundary, a distance of 93 miles.

Welland, Ont.—The Union Carbide Co. plant, the largest in Welland, will be finished and ready for machinery inside of a month. The Lackawanna Bridge Co. are doing the steel work.

Montreal, Que.—The five-storey warehouse of Frothingham & Workman on St. Paul St., was destroyed by fire on Jan. 13. Damage to stock amounted to $285,000; and damage to the building $20,000.

Sarnia, Ont.—Fourteen new smokestacks instead of nine will be constructed at the Imperial Oil Co. plant this year. One of the stacks will be 160 feet, and another 155 feet. The others will be smaller.

Grimsby, Ont.—The Pelee Island Wine Co. are preparing plans for a factory, 150 x 50, to be equipped with electrical machinery. There will be a cooper shop in connection with it. J. Dawe, St. Catharines, Ont., architect.

Berlin, Ont.—The Berlin Plate Glass and Mirror Co. has purchased a lot on Victoria and Edward Streets, on which a new factory building will be erected. The structure will be of two storeys, with cement foundation, and provide 13,000 feet floor space.

Elk Lake, Ont.—The Mapes-Johnson Mining Co. are moving their machinery from the Montreal-James, the plant which they purchased, to their property at Silver. The plant now being installed will furnish compressed air for the drills, and expedite the work very much.

Lethbridge, Ont.—The Bathurst Mining Co., 302 Sherlock Building, has been reorganized and have started their mine at Diamond City. They have acquired additional coal land, and will enlarge their present plant during the ensuing year. A. W. Cooley is president and manager.

Toronto, Ont.—J. L. Englehart, president of the T. & N. O. Railway, stated last week that a paper mill would shortly be built on the Abitibi River. Who the people behind the move are he was not at liberty to state, but bonds to the amount of $3,000,000 had been sold to American capitalists.

Caledonia, Ont.—A fire destroyed the plant of the Laurentia Milk Co. on January 13, causing a loss of about $25,000, only partially covered by insurance. They had recently installed some very fine machinery. The company is backed by local and Toronto capital. A. F. McLaren, ex-M.P., is president. The plant will be rebuilt.

Municipal

Herbert, Sask.—The town will spend $7,000 on a fire engine and apparatus.

Lauzon, Que.—The town is considering the erection of a new waterworks.

Brantford, Ont.—It is almost certain that the city will purchase a motor fire truck this year.

Sarnia, Ont.—Mayor Dagan favors the establishment of a municipal plant for making cement roads.

Toronto, Ont.—It is proposed to install a new electric elevator in the city hall, costing $4,500, and a sprinkler system.

Listowel, Ont. — Fire destroyed the town hall and the fire fighting apparatus, Jan. 14, doing damage amounting to $10,000.

Toronto, Ont.—The city will purchase four new auto trucks to assist in the collection of the garbage at a total cost of $24,000.

Courtright, Ont.—The council has given a final reading of the by-law to give the Union Gas Co. a 25-year franchise.

Galt, Ont.—The Waterworks Department will soon be in the market for electrically-operated valves for the pumping station.

Galt, Ont.—Frank B. Tomb, representing the Dominion Natural Gas. Co., has assured the council that a purifying plant will be built on the east side of the town where the main enters.

Fort William, Ont.—By-laws providing $37,000 for waterworks, $125,000 for telephones, $238,000 for street railway, $115,500 for electric light system, $30,000 for stone quarry, all passed.

Verdun, Que.—The city in a few weeks will be operating a new pumping plant of 4,000,000 gallons' capacity. There are also two reserve pumps of 3,000,000 gallons' capacity.

Montreal, Que.—Reports on the water situation recommend the installation of new hydraulic pumps, and a number of new mains. A high pressure system of water supply is again urged.

Peterboro, Ont.—By-laws providing $78,000 for the construction of a bridge, $8,000 for the purpose of purchasing a motor-driven combination chemical engine and hose wagon, were both defeated.

Winnipeg, Man.—The council has voted in favor of a by-law to permit a company to seek legislation for power to run a service of motor busses in Winnipeg. It is proposed to have 200 on the streets within two years.

New Liskeard, Ont.—A meeting was held here last week, when five townships were represented by the heads of the councils, to discuss the advisability of co-operating with the view to building permanent roads by purchasing a stone-crushing outfit.

Montreal, Que.—A sum of $100,000 was voted by the council for the connection of the conduit to the Lachine Canal. Instructions were also given to the Legislation Committee to ask the Legislature for power to borrow the sum of $1,000,000 in case the city wishes to build a second intake pipe.

Port Arthur, Ont.—By-laws providing $35,000 for street railway expenses, $8,000 for street lighting improvement, $55,000 for improvements to the electrical power system, $35,000 for telephone system, $53,740 for extensions to the sewer system, $202,167 for the extension of the waterworks system, all passed.

Toronto, Ont.—Works Commissioner Harris has submitted a plan to the council for the extension of the waterworks at an estimated cost of $6,677,000. The following is a list of equipment required and the estimated cost:—Pumping equipment, $380,000; boilers and stokers, $80,000; coal and ash handling machinery, $30,000; tracks and overhead equipment from York to Pumping Station, $35,000; motor and equipment for handling cars, $5,000; electric lighting unit at station, $2,000; twenty-six miles of distribution mains, $2,040,000; specials and valves, $60,000; filtration plant, $600,000; six miles of distribution main (High Level Pumping Station to West Toronto), $353,000; additions to High Level Pumping Station, and provision of steam reserve sufficient for ultimate output of this station, $250,000.

Tenders

Winnipeg, Man.—Tenders will be called for the construction of footings for the second transmission line to the power plant east of Lac du Bonnet and through the Muskeg country next week.

Toronto, Ont.—The Board of Control has extended the time for receiving tenders for the million-dollar extension to the Island filtration plant until Jan. 30, after receiving an application for extension of time on behalf of the Pulsometer Engineering Co., London, England.

Winnipeg, Man.— Tenders addressed to the Chairman, Board of Control, will be received at the office of the undersigned up to Friday, February 20th, for the supply of Overhead Construction and Line Materials required by the City Light and Power Department during the year 1914.

Assiniboia, Man.—Tenders will be received by the undersigned up to 4 o'clock p.m., on Monday, the second day of February, 1914, for the supplying and erection of a plate girder bridge with concrete floor across Sturgeon Creek, on Saskatchewan avenue. Length of bridge is to be 35 feet, and the width 20 feet. Plans and specifications may be seen at the office of the Municipal Engineer, at the Municipal Hall, St. Charles, Man.

Lacombe, Alta.—Tenders addressed to the undersigned and endorsed Tenders for Railway Construction, will be received until Saturday, January 31, for construction of about 15 miles of the Lacombe and Blind Man Valley Electric Railway between Lacombe and Bentley, Alta. Plans, forms of tender, specifications and all other information may be obtained from Farncombe and Inkster, Engineers, Edmonton South, or from M. N. McPhee, Engineer in charge, Bentley, Alta.

Marine

Vancouver, B.C.—A company headed by Ex-Ald. J. D. McNeill has purchased a water frontage on False Creek, and tenders will be called immediately for the construction of a dock. The land will be developed for industrial and shipping purposes.

Sarnia, Ont.—It is reported that the LeBel Lumber Co. is bargaining for another lumber steamer, to take the place of the Lillie Smith, sold last fall.

Port Dover, Ont.—It is understood that the Government estimates will contain a generous sum for the Port Dover Harbor. Port Dover is terminus of the new Lake Erie and Northern Railway, which will soon connect Galt, Brantford and Simcoe with Lake Erie.

Contracts Awarded

Guelph, Ont.—The Guelph Radial Railway Board has awarded a contract to the Preston Car and Coach Co. for two new street cars.

St. Thomas, Ont.—The general contract has been awarded for the erection of a new Y. M. C. A. building to A. E. Ponsord of St. Thomas.

Toronto, Ont.—The tender of John T. Hepburn, Toronto, for a travelling crane for the main pumping station was accepted by the controllers.

Calgary, Alta.—The city council has awarded the contract for a 1,000 k.w. synchronous motor generator and exciter set to the General Supplies, Ltd., at $18,250.

Yorkton, Sask.—The Boving Co. of Canada, Ltd., has secured the contract for the supply and delivery of one 500 b.h.p. combined unit Diesel required by the town council.

Ottawa, Ont.—The Government has awarded a contract to Jennings & Ross, Ltd., for the construction of a dam at the head of Big Chaudiere, French River. The contract price was $23,124.40. A contract was also awarded to William Dewar for the construction of an extension to a wharf at Gull Harbor, Man.

Substation Apparatus and Car Equipment.—The Toronto Suburban Rly. Co. has just closed a contract with the Canadian General Electric Co. for substation apparatus and car equipments, for the new line which will run west from Toronto through Georgetown, Guelph and Berlin. A very interesting feature is that this will be the first interurban line in Canada to operate at 1,500 volts direct current. The catenary type of overhead construction will be used, and there will be three substations at Islington, Georgetown and Guelph respectively. Rotary converters of 1,500 volt, 500 k.w. capacity each will be used, power being transmitted to the substations at 25,000 volts. Provision will also be made for the supply of power from a separate bank of transformers in each substation for distribution along the line for mis-

cellaneous power and lighting purposes. The cars will be equipped with four 85 h.p. motors of the latest type; fully ventilated and the control will be of the multiple unit type to permit of train operation. These cars will operate on a 600 volt line at approximately half normal speed, and changing from 1,500 volt to 600 volt trolley or vice-versa will involve no loss of time whatever in adjustment of control apparatus. The line with 1,500 volt operation will be about 62 miles long.

Refrigeration

Saskatoon, Sask.—W. B. Neil, ex-industrial commissioner, is proposing to start a meat packing plant.

Richmond, Que.—The Board of Trade have appointed a committee to secure data regarding the establishment of a central cold storage plant in the Eastern Townships.

London, Ont.—The plant being erected by the London Cold Storage Co., to manufacture ice is nearing completion. The system of freezing being installed was decided upon after much consideration, and the plant when finished will be one of the best on this continent.

Fort William, Ont.—The Armour Packing Co., Chicago, are looking for a site in Fort William. A representative, said to be the superintendent of agencies, has looked over various locations. Until the Company can erect their own cold storage plant, they are looking for a temporary location with cold storage facilities.

Railways—Bridges

Sarnia, Ont.—The Sarnia Street Railway, it is said, is contemplating extensions.

Montreal, Que.—The Montreal Tramways Co. will put 25 new cars and 25 trailers into service.

Welland, Ont.—The Niagara, Welland and Lake Erie Railway is preparing to build an extension to Dain City.

Toronto, Ont.—Works Commissioner Harris has reported that it is possible to construct a bridge over the railway tracks on line of Morrow Avenue. The estimated cost would be $131,807.

Brantford, Ont.—W .P. Kellett, if he secures control of the street railway, will put in new rolling stock, and reconstruct the road.

London, Ont.—Engineers in the employ of the Ontario Hydro-Electric Commission are preparing a survey for the proposed hydro radial between London, St. Mary's and Stratford.

Fort Erie, Ont.—The Canadian Boulevard Commission will build a trolley line from Niagara Falls to the proposed terminal at Fort Erie, and have it in operation inside of two years.

Toronto, Ont.—Commissioner Harris has presented plans for the new Gerrard Street bridge to the Board of Control, to cost $382,000. He recommended the highest tender, because it would give a 66-foot width and carry 40-foot cars.

Toronto, Ont.—The residents of Humber Bay and the southern portion of Etobicoke Township are urging the city to construct an electric line along Queen street from the Lake Shore road, in order to give them more rapid transportation into the city.

Montreal, Que.—Laprairie, Que., will apply to the Dominion Railway Commission for an order to build an over-head construction on Victoria bridge for the trolley cars, on the ground that space on the bridge at the disposal of vehicles is too small.

London, Ont.—The offer of the Michigan Central Railway to loan its gangs to the city for the reconstruction of the London and Port Stanley Railway will be taken advantage of, and work will be undertaken in the spring. Electric trains will be operated between this city and the lake not later than September.

Toronto, Ont.—The Toronto & Suburban Railway Co., having refused to construct a trolley line on Jane street from Bloor to Annette street, and along Bloor street, the city is now free to build this line. The city council six months ago approved a recommendation of the city engineer to require the railway Company to build the line.

Sarnia, Ont.—Initial steps are being taken towards the construction of the proposed hydro-electric railroad line from Sarnia to London. The style of construction will be known as the heavy electric with solid roadbed, and the passenger traffic will be handled by cars similar to those on interurban lines in Michigan.

Montreal, Que.—It is expected that in a few weeks the Dominion Railway Commission will be petitioned to approve plans for the elevation of the Grand Trunk tracks between Cote St. Paul Road and Bonaventure station and St. Henri Station and Wellington street. This will embrace the building of nearly five miles of viaduct at an estimated cost of $5,500,000 and the construction of nineteen subways. The G. T. R. will build a new station at St. Henri, and a new Bonaventure Station at a cost of from a million to two million dollars.

Trade Gossip

Ottawa, Ont.—The Ottawa Car Works have been purchasing machine tools for extra large work

Merritton, Ont., will shortly have a by-law compelling its manufacturers to use smoke consumers.

The Lafrance Improved Pipe Joints Co. Ltd., Montreal, have changed their name to Fittings Foundry, Ltd.

Roxton Pond, Que.—The Roxton Tool and Mill Co. Ltd., has increased its capital from $100,000 to $300,000.

T. C. Norris, leader of the Opposition in the Manitoba Legislature, last week moved a resolution that agricultural implements from the United States be admitted free of duty.

C. M. Power, general sales manager of the Standard Chain Co., Pittsburg, was in Montreal last week to confer with Alex. Gibb, general sales agent for Canada, St. Nicholas Building, Montreal.

The Montreal Motor Show will be held during the last week of January and the first week in February in the Drill Hall, Craig street. The second week will be devoted to motor trucks and business vehicles.

C. J. Garry, general manager of the International Marine Signal Co., Ottawa, says the rumor that his Company is going out of business is untrue, and that the plant is closed down to allow of reorganization.

Goold-Shapley & Muir Co., Brantford, Ont., held their twenty-first annual meeting last Saturday afternoon. E. L. Goold, president, read the annual report, and announced a turnover of $40,000 larger than that of the previous year.

The Massey-Harris Co.'s agents in Hamilton district held a banquent at the Waldorf Hotel, on Jan. 16. R. Armitage, the company's representative in Hamilton, was presented during the evening with a pair of oak chairs.

Welland, Ont.—The Canadian Steel Foundries plant has resumed active manufacturing operations. The foundry is now working six days a week instead of only three, and the rolling mill is gradually giving employment to more men. It is expected that the entire plant will be running full again within a short time.

S. Samuel, of M. & L. Samuel, Benjamin & Co., Toronto, leaves this week for Europe, where he will remain for a number of years. G. T. Pepall, who has been associated with the firm for twenty-two years, will manage the business. This is one of the oldest established metal firms in Canada, having commenced operations here in 1855.

The Western Drydock and Shipbuilding Co., Port Arthur, Ont., received a cheque last week from the city, for $25,000, being the yearly bonus given since their establishment. The Company guaranteed to employ 300 men for 300 days per year. It now employs 728 men for 300 days, and its yearly payroll is $500,000.

The A. R. Williams Machinery Co., whose machine tool agencies have undergone considerable change recently, have secured the exclusive Canadian agency for the R. K. LeBlond Machine Tool Co., Cincinnati, O. They have also secured the exclusive agency for Dreses Radial Drills, manufactured by the Dreses Tool Co., Cincinnati.

The Port Arthur Board of Trade asked Winnipeg City Council to support a proposition advocating that the Dominion Government grant a bonus of fifty cents on each ton of Canadian iron ore mined and smelted during the next ten years, providing that the bonus in the aggregate should not exceed one million dollars in any one year of such period. The council decided not to support the proposition.

Sheldon's, Ltd., Galt, Ont., have recently made the following sales:—Heating and ventilating equipments for the Dominion Bank, New Technical School, Marcus Loewe's Theatre, civic car barn and Children's Hospital, all in Toronto; the Laurentide Pulp Co., Grandmere, P.Q.; the Abitibi Pulp and Paper Co.; Iroquois Falls, Ont.; the Provincial Jails at Victoria and Burnaby, B.C.; the C. P. R. shops on North Bay, Ont.; the J. H. Still Mfg. Co., St. Thomas, Ont., and a Public school at Saskatoon, Sask.

New Automobile Factory.—A St. John, N.B. despatch says that New York capitalists have leased a site adjoining the Ford Motor Co. property at Coldbrook, three miles from that city, and the Dominion Motor Car Co., Ltd., announce that they will erect an automobile manufactory and also start a brick-making industry. The names mentioned are H. M. Kilburn, of the National City Bank, New York; P. A. Rockefeller, J. H. Flagler, and two prominent directors of an American automobile factory, John A. Graham and Leslie F. Bond.

John Bertram & Sons, Dundas, Ont., held the sixth annual entertainment under the auspices of the employees' mutual benefit association in the Music Hall on the evening of Jan. 15. About 250 were present. The association gives this entertainment free every year to its members, charges its members a fee of 40 cents per month, and pays a sick benefit of $4 per week, with a limit of 18 weeks. Whenever the general fund amounts to $300 a monthly assessment is cancelled. This happened three times in the last year.

The British Columbia Marine Railway Co., Esquimalt, B.C., whose shipyards have been sold to Yarrow & Co., Glasgow, was founded in 1893 by W. Fitzherbert Bullen, president, who came from London, Ont. H. F. Bullen, managing director, is a native of the same city. George Gordon Bushby is a director, and manager of the Vancouver branch. Douglas B. F. Bullen, secretary-treasurer, is a son of the president. They retain their interest in the B.C. Salvage Co., and the Vancouver branch of the B.C. Railway Co.

Personal

James Collins Miller, M.A., B.Sc., Ph.D., has been appointed Director of Technical Education for the Province of Alberta.

TRY THIS DRILL ON THE HARDEST WORK YOU HAVE IN YOUR SHOP

The efficiency of a drill means its accuracy, its cutting ability and the amount of work it can do well without regrinding.

The Wilt Twist Drill is made by a new process—a process that completes the drill at a single chucking.

This means accuracy and uniformity to a marvelous degree and when coupled with scientifically accurate hardening, in an electric furnace, produces a drill that is efficient to the highest degree.

Ask Your Supply Man—or Write Direct.

CASTINGS

MANGANESE
BRONZE CASTINGS

We have made a specialty of this material for years and can satisfy your rigid specifications. Our specifications 70,000 to 75,000 tensile strength.

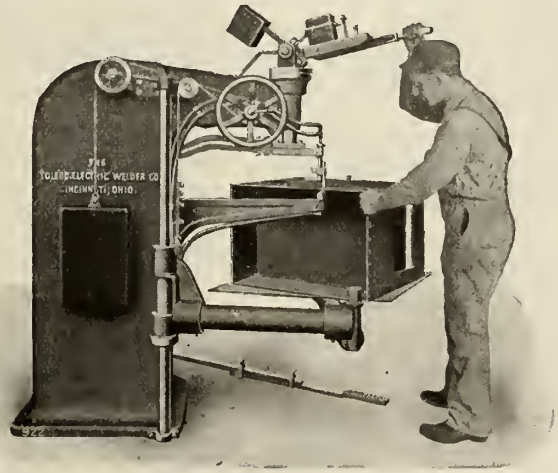
20 per cent.—25 per cent. Elongation.

(Am. Soc. Testing Materials Methods.)

Lumen Bearing Company
Buffalo BRASS FOUNDERS Toronto

The above is our 25 K.W. butt-welder, capacity ¾ in. to 1½ in. round and 2 in. pipe.

Convertible clamps for welding flats and bands.



We make other sizes of butt-welders and a full line of SPOT welders.

Write for catalogue.

AGNEW ELECTRIC WELDER CO.,
WALKERVILLE, ONT. Limited

Costs 250% More to RIVET Than to SPOT WELD

This boy is Welding Stove Bodies

He does more work than NINE RIVETERS can do

LABOR COSTS REDUCED FROM 60 TO 95%

There is hardly a riveting job that cannot be done more cheaply and better the electric way—the "TOLEDO" way. Try a "TOLEDO" for 30 days. If it doesn't save money for you—you don't want it; ship it back. **That** shows our confidence in "TOLEDO" welders. Send us samples of the work you want to do. We will weld them free of charge, return them to you, and tell you what you can save.

Bulletin No. 15 tells about spot welders. Bulletin No. 14 about butt welders.

NO LEASE. NO LICENSE. NO ROYALTY.

THE TOLEDO ELECTRIC WELDER COMPANY

You can talk across the continent for two cents per word with a WANT AD. in this paper

John Wanamaker says that advertising doesn't jerk—it PULLS. He ought to know, and yet some men think that advertising should go against all rules and precedents and jerk them to success with one tremendous yank.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

The "No-Wear" Nozzle
An exclusive feature of the
"Sly" and Satisfaction

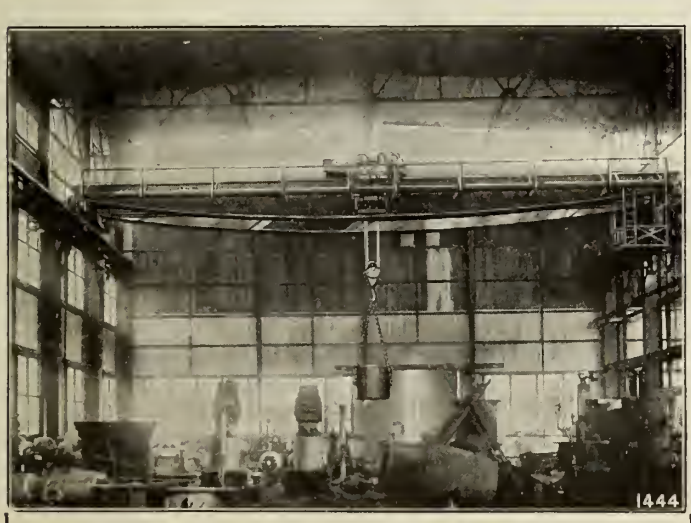
And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.



Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

NEW SIDE-HEAD BORING MILL

Embodies many new and distinctive features, including independent side head, power rapid traverse for both turret and side head, and a most extensive system of flood lubrication.

Most Advanced Design in Every Detail

Every known feature for easy, convenient operation and rapid, accurate production. *Convenient Control*—all operating levers are most conveniently located. In engaging feeds and power traverse levers are advanced in the direction which the movable member is to travel. It is impossible to injure machine through improper manipulation of operating mechanism. *Power Rapid Traverse* in vertical and horizontal directions is provided for both *vertical and side heads.*

Swings with side head in position—38", with side head down —44". Maximum from table top to under side of cross rail — 26", to turret face — 38". Vertical head travels 28" vertically. Side head travels and will turn 26" vertically.

Instant Control of Speeds and Feeds

Twelve speeds are instantly obtainable, varying in geometrical progression from 3.2 to 70 r.p.m. Levers are located directly below table. There are 16 positive, independent changes of feed from .004 in. to .750 in.

Independent Side Head. Side head is entirely independent of cross rail and can be lowered below table enabling machine to take work up to 44 in. in diameter.

Durable Gearing. Table-drive unit and feed units are of a new selective, sliding-gear type. Gears are made of alloy steel, heat-treated and hardened, which together with liberal proportions make them practically indestructible.

Flood Lubrication is most extensively utilized, all feed units, table-drive mechanism, cross-rail elevating mechanisms as well as spindle bearings have an ample and continuous supply of oil.

Pratt & Whitney Company, Hartford, Conn., U.S.A

SALES AGENTS FOR CANADA:

A Twist of the Wrist

and you have either Pipe or Monkey Wrench. Without fumbling in tool kit or wasting valuable time in looking around, the

"Bemis & Call" Combination Wrench

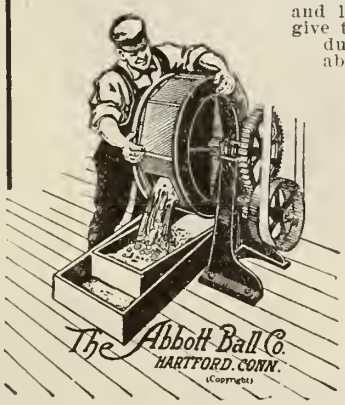
gives you instantly which you require of these two useful tools.

Its sturdy forged steel, case-hardened construction, and long sleeve nut, ensure it a long life, and the interchangeable method under which it is made, facilitates renewals at all times.

Our catalog on request.

BEMIS & CALL HARDWARE AND TOOL CO.

SPRINGFIELD, MASS., U. S. A.



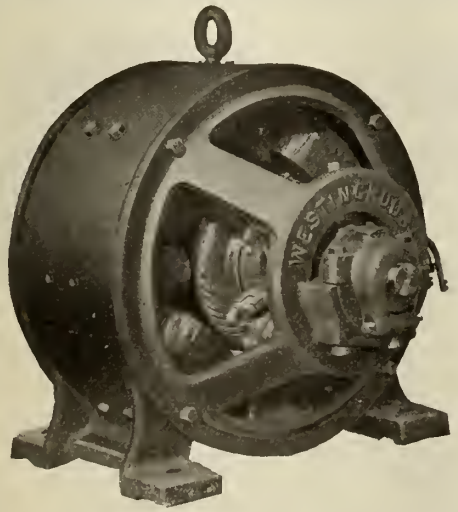
75% Reduction!

in your polishing costs.

Doesn't that sound pretty good to you? Isn't it worth going after if we show you the way?

It's very simple — reducing your polishing expenses—replace that long line of buffing operators by one man and two or more

Abbott Burnishing Barrels



and let the glass-hard steel balls give to your product a finish—more durable than that of polishing at about a quarter the cost.

The Abbott effects this saving because it handles hundreds of pieces at a time and requires an operator only at loading and unloading times.

Send us samples to burnish and write for our free book.

Abbott Ball Co.

Elmwood, Hartford, Conn.

Quick Work Means Low Cost

The longer a job is at the machine tool the more it costs. The rate at which work is finished depends on the time required to adjust the tool and to cut the metal. At each step

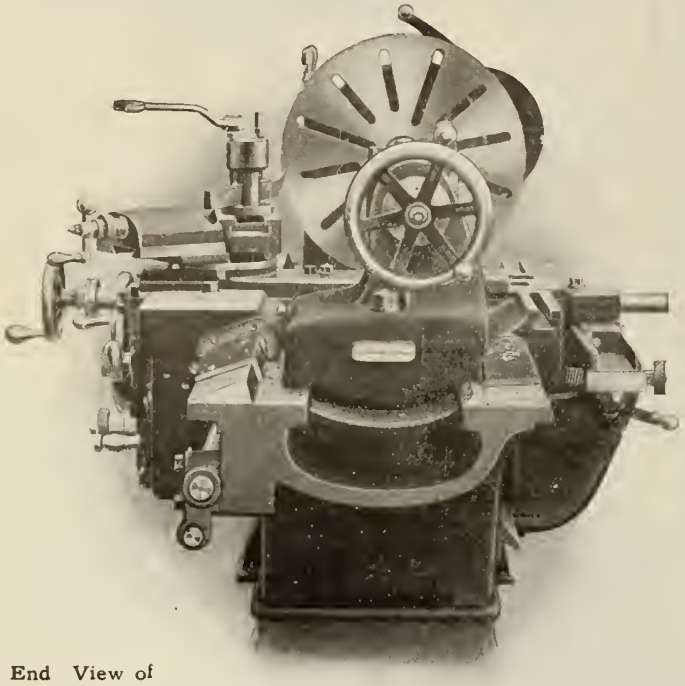
Westinghouse Type SA Adjustable-Speed Motors

will save time and money

With Westinghouse machine tool equipment the operator has complete control over the tool and can adjust his work with the greatest speed and accuracy.

The large number of speeds provided permits exactly the right cutting speed to be used—not too slow to drag the job, or too high to break tools.

The result is maximum economy.



Westinghouse equipment is thoroughly satisfactory because of the long experience of the Canadian Westinghouse Company with machine tool drive.

LeBlond Heavy Duty Lathes

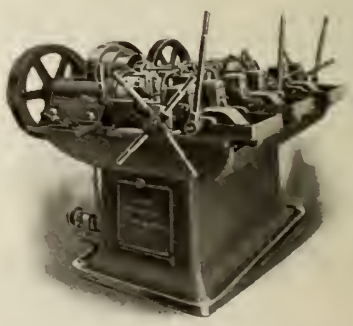
End View of H. D. Lathe.

Are especially adapted to the heaviest kind of manufacturing and modern high speed production. They are not the regular type of lathe dubbed heavy duty, but machines designed and built for just this kind of work.

WRITE FOR DETAILS.

The R. K. LeBlond Machine Tool Co., Cincinnati, Ohio

Canadian Agents—The A. R. WILLIAMS MACHINERY CO., Toronto. Montreal, Winnipeg



DESIGNED TO MEET SERVICE CONDITIONS

Heat generated limits the speed of a cutting tool. The **Landis Die** was designed with this end in view. Line contact, natural clearance and flexible rake—all help reduce the friction at the cutting edge. That's why the **Landis Die** excels as a producer.

In one plant eight Landis Machines have replaced thirty-two of another make, and at that are producing more work. Another concern is getting three times the output from our machines that they could procure from the same number of hobbed die machines.

Write for our catalogue No. 21.

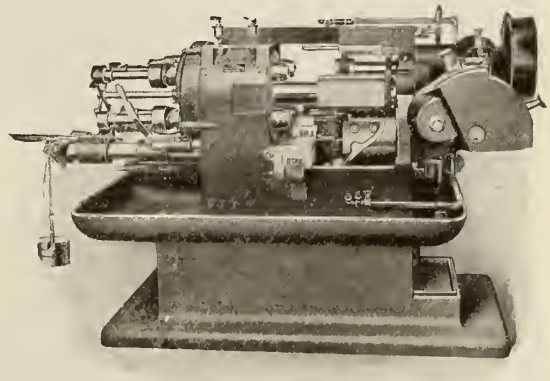
THE WARNER & SWASEY CO., Cleveland, Ohio, U.S.A.

Canadian Representatives: A. R. Williams Machinery Co., St. John, Toronto, Winnipeg and Vancouver, and Williams & Wilson, Montreal.

"Don't worry about the feed"

It needs great skill to tell the difference between a feed of 100 per inch and one of 125 per inch, with the eye alone. It needs greater skill to set cams on an automatic so that the feed will be just the best—just as heavy as the tools will stand.



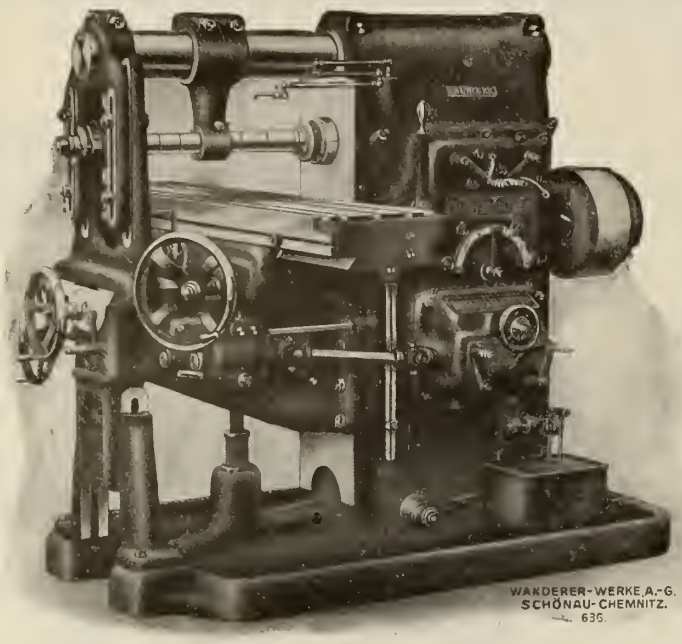
And the careful operator errs on the right side—he's got to keep the tools in shape.

Which is fine, but—

If you're cutting metal with a 125 feed, that you could be cutting at 100, you're losing just 25% of your proper output.

That's just where **Gridley Multiple Spindle Automatics** are streets ahead of any other machines of their class. With them, you set the machine up, complete the camming, without bothering about the proper feed. Then—when you're actually cutting metal, finding the right feed means moving one simple lever only.

The operator hasn't got to figure anything, he just increases the feed till he finds the tools won't stand any more.



And this means maximum production for you.

This one feature alone makes them worth investigation, but there are many others, all equally important. "Gridley Automatics" tells of them.

Ask for it.

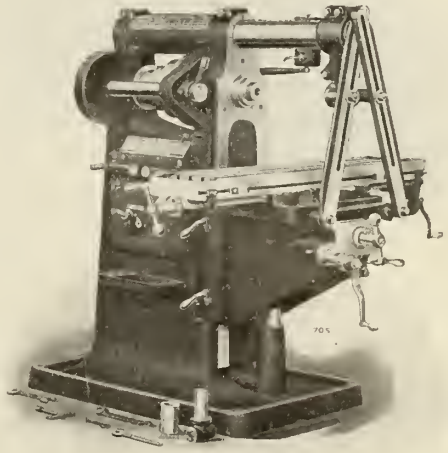
The largest special manufactory for the construction of Boring and Milling Machines

The advertiser would like to know where you saw his advertisement—tell him.

If You Manufacture In Large Quantities



and if you have a piece similar to this, THEN you ought to be interested in the **CINCINNATI METHOD of MILLING.**

This method enables one of our customers to finish to gauge the 10 GROOVES of the grey iron seed roll in 1.3 MINUTES.

This is equivalent to continuous milling at the rate of 17 inches per minute, and it is kept up ten hours a day.

Here's The Machine That Does It

It's not a single pulley nor a manufacturing miller, but it represents the most suitable type of machine for this work, and one that will give the greatest output per dollar of investment.

Our Time Study Department designed this complete equipment.

Send them one of your milling problems. They'll submit a method of reducing your milling costs that is bound to interest you.

Atlas Worm Geared Block.

Schuchardt & Schutte, 307 Coristine Building, MONTREAL, QUE.

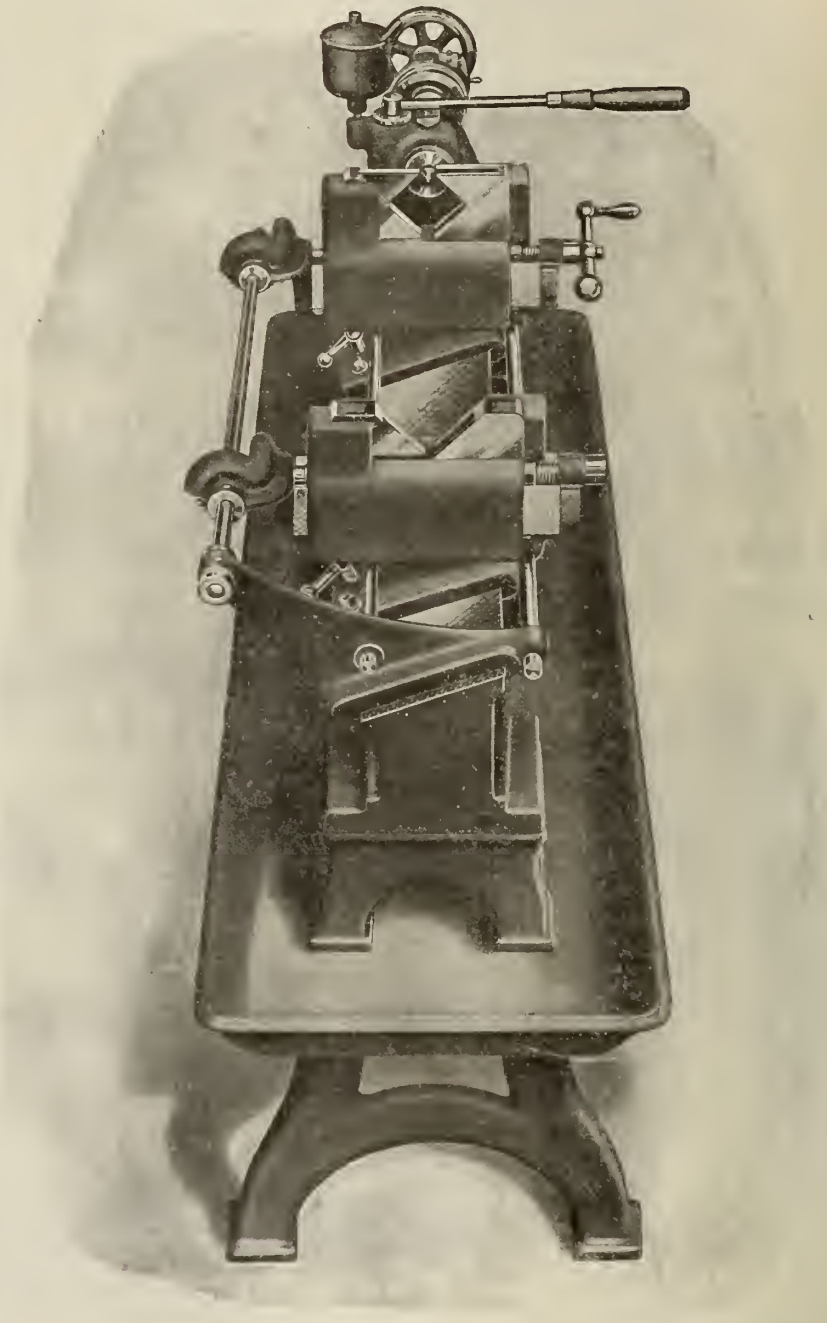
"Hendey" Centering Machine

Made to meet the demands of those who want a machine that will centre within reasonable limits of accuracy, (test allowance .0025" eccentric) and amply proportioned in spindle bearings, etc., to withstand wear and tear.

Head and Spindle Construction. The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, front journal being made taper after the well-known pattern of the Hendey lathe head. Thrust taken by ball bearing. Spindle carries watch tool chuck for accurately and conveniently holding combination centre drill and reamer. One motion only to get centre. Back locking pin working in angle of pulley is provided for use when necessary to remove or replace centre drill.

Jaws of Vise and supporting block are hardened and ground.

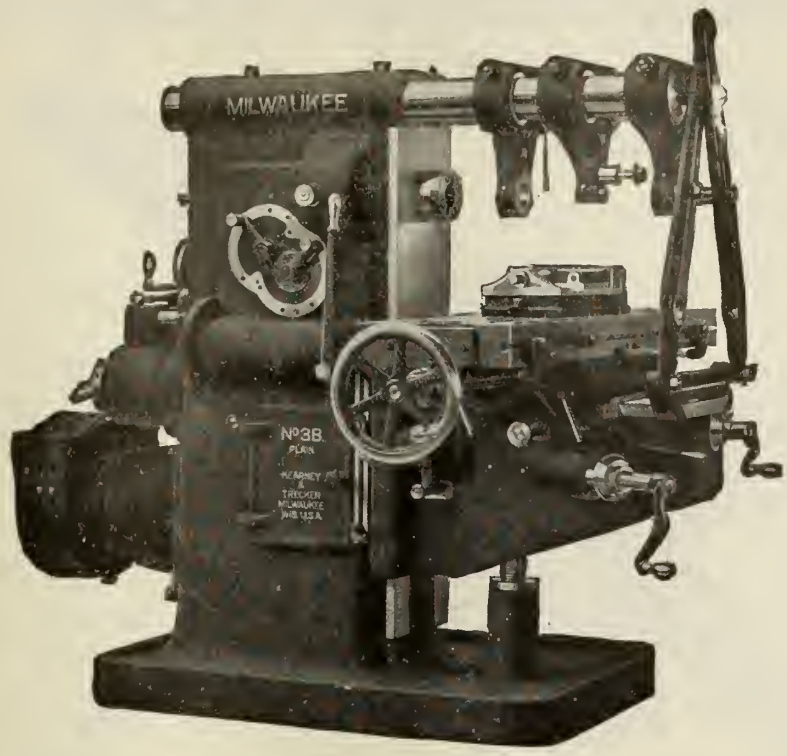
Alignment of Spindle with Jaws. Jaws are aligned from spindle by proof bar carried in spindle. This care in alignment is exercised in order to enable machine to accurately centre stock for finishing purposes after coming from turret lathe or screw machine.



Relative Movement of Vise and Block is maintained by means of the connecting rod and bevel-geared drive at back of machine, controlled from the one ball handle at front of vise. This means that, no matter what the diameter of the bar may be within the limits of the machine, it will **always be supported in a horizontal position,** there being no hand adjustment and "eye-alignment" necessary for back support.

Inclined Surface of Bed, sloping away from operator, tends to direct the chips into the pan, rather than have them accumulate around the head, necessitating frequent cleanings when it is desired to shift vise carriage.

Saddles are gibbed and fitted to bed, and provided with binding handles for ready clamping in position.



Heavy Parallel Bars, running the length of machine, serve the two-fold purpose of a rack for carrying stock to be centered, and, in connection with the inclined bed, prevent it from being bruised and banged through common use of bed as temporary support for the stock.

Capacity of Machine is from 5-16 to 4 inches, inclusive.

The Hendey Machine Company, TORRINGTON, CONN.

Milwaukee Millers

Their Versatility Means Much to the Small Manufacturer

Every shop equipped for any range of work must have a horizontal-spindle milling machine.

Where the amount of work does not warrant installing both horizontal and vertical spindle machines, or where it is desirable to have one very flexible machine rather than two separate machines, Milwaukee horizontal-spindle Millers with vertical-spindle attachment serve admirably.

Frequently, too, some work will turn up that baffles the ingenuity of the best mechanics in the shop. In such cases Milwaukee horizontal-spindle Millers with universal milling attachments will solve the problem. This attachment broadens the scope of the machine to take in a large variety of universal milling work.

Again, the amount of slotting work is not always sufficient to enable a slotter to pay dividends on its purchase. In this event, it is a slotting attachment for Milwaukee horizontal-spindle Millers that overcomes the difficulty.

These attachments embody the same excellence of design and careful attention to details that characterize the machines themselves.

We recognize primarily that the attachment must be properly designed to form a rigid and effective unit with the machine.

Our attachments are therefore made exceptionally rigid and heavy. We also extend the dovetail on the face of the column up to the over-arm. It is thus possible to clamp the attachments to the machine and secure practically the same rigidity as though the attachments were actually cast as part of the machine.

The sturdy and rigid construction of the attachments for Milwaukee horizontal-spindle Millers enables them to withstand severe and constant usage.

They are not limited to very light work. Not only are they suited to meet the unusual and occasional job, but they may also be used to advantage on day-to-day work.

A Milwaukee horizontal-spindle Miller with its various attachments fits the shop for a truly tremendous variety of work.

To the small manufacturer, especially, this is important. On a much smaller investment he can handle a greater amount of work. His machine will be idle less often. He will economize on floor space.

The various attachments are sold separately.

Write for Bulletin. They tell all about the excellence of Milwaukee Millers and their attachments.

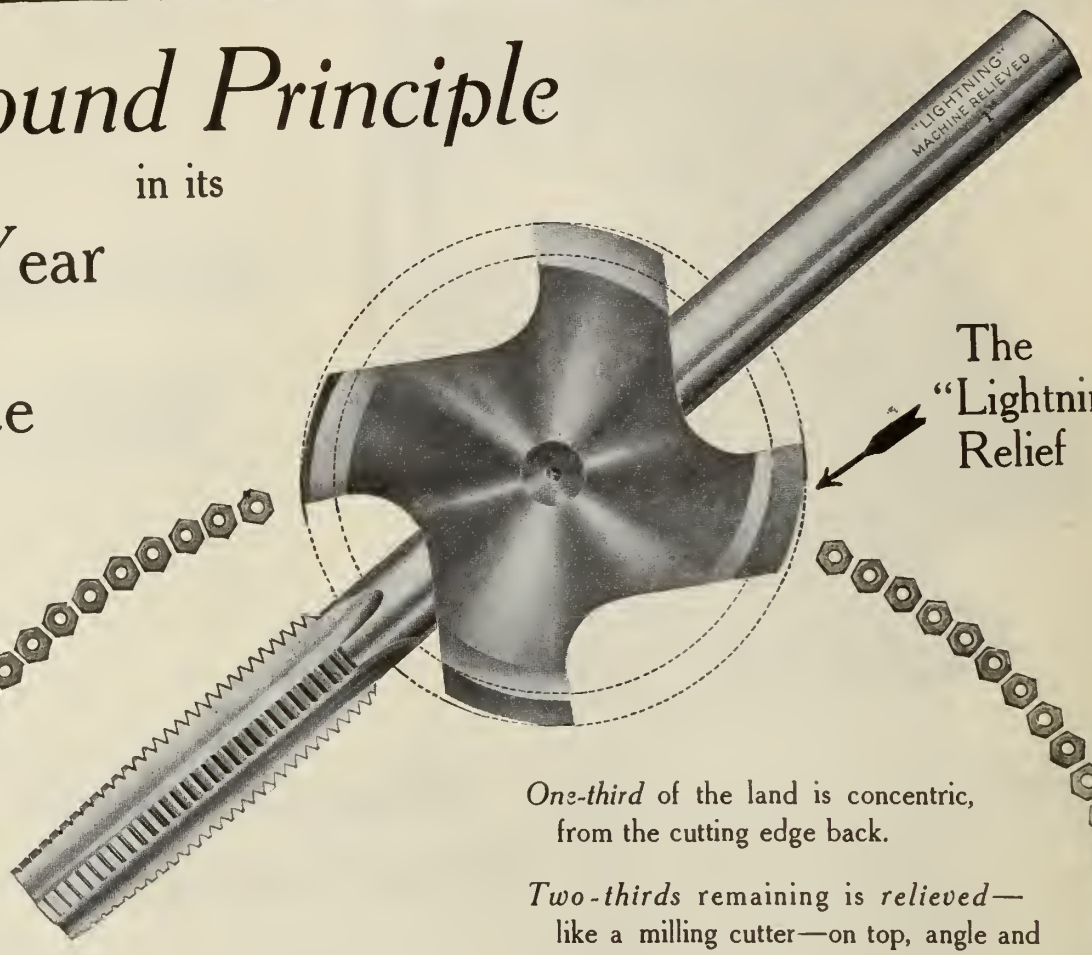
THE TAP THAT MADE GREENFIELD FAMOUS



A Sound Principle

in its

30th Year

of

Practice

The "Lightning" Relief

One-third of the land is concentric, from the cutting edge back.

Two-thirds remaining is *relieved*—like a milling cutter—on top, angle and bottom of thread.

For 30 Years

We have faithfully and consistently supported the principle of a *relief on every tooth in the tap.* We stand by that principle today.

For 30 Years

We have sold *"Lightning" Taps* based on the claim that our *machine relief* reduces friction, aids free cutting and thus greatly prolongs the life of the tap.

Thousands of satisfied users testify that we have

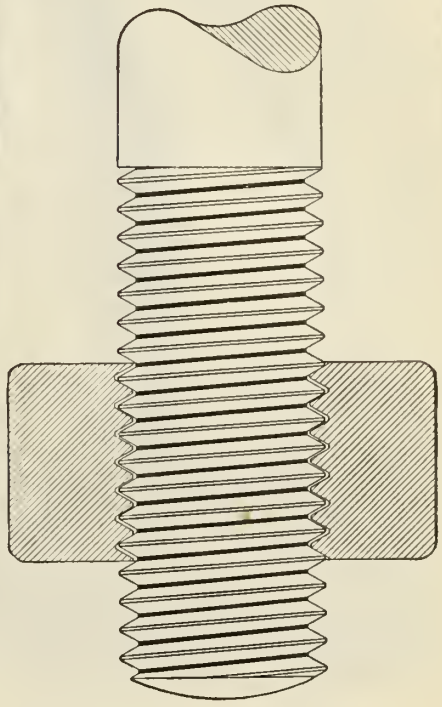
Makers of Bolts and Screws! Attention!



Too Slow

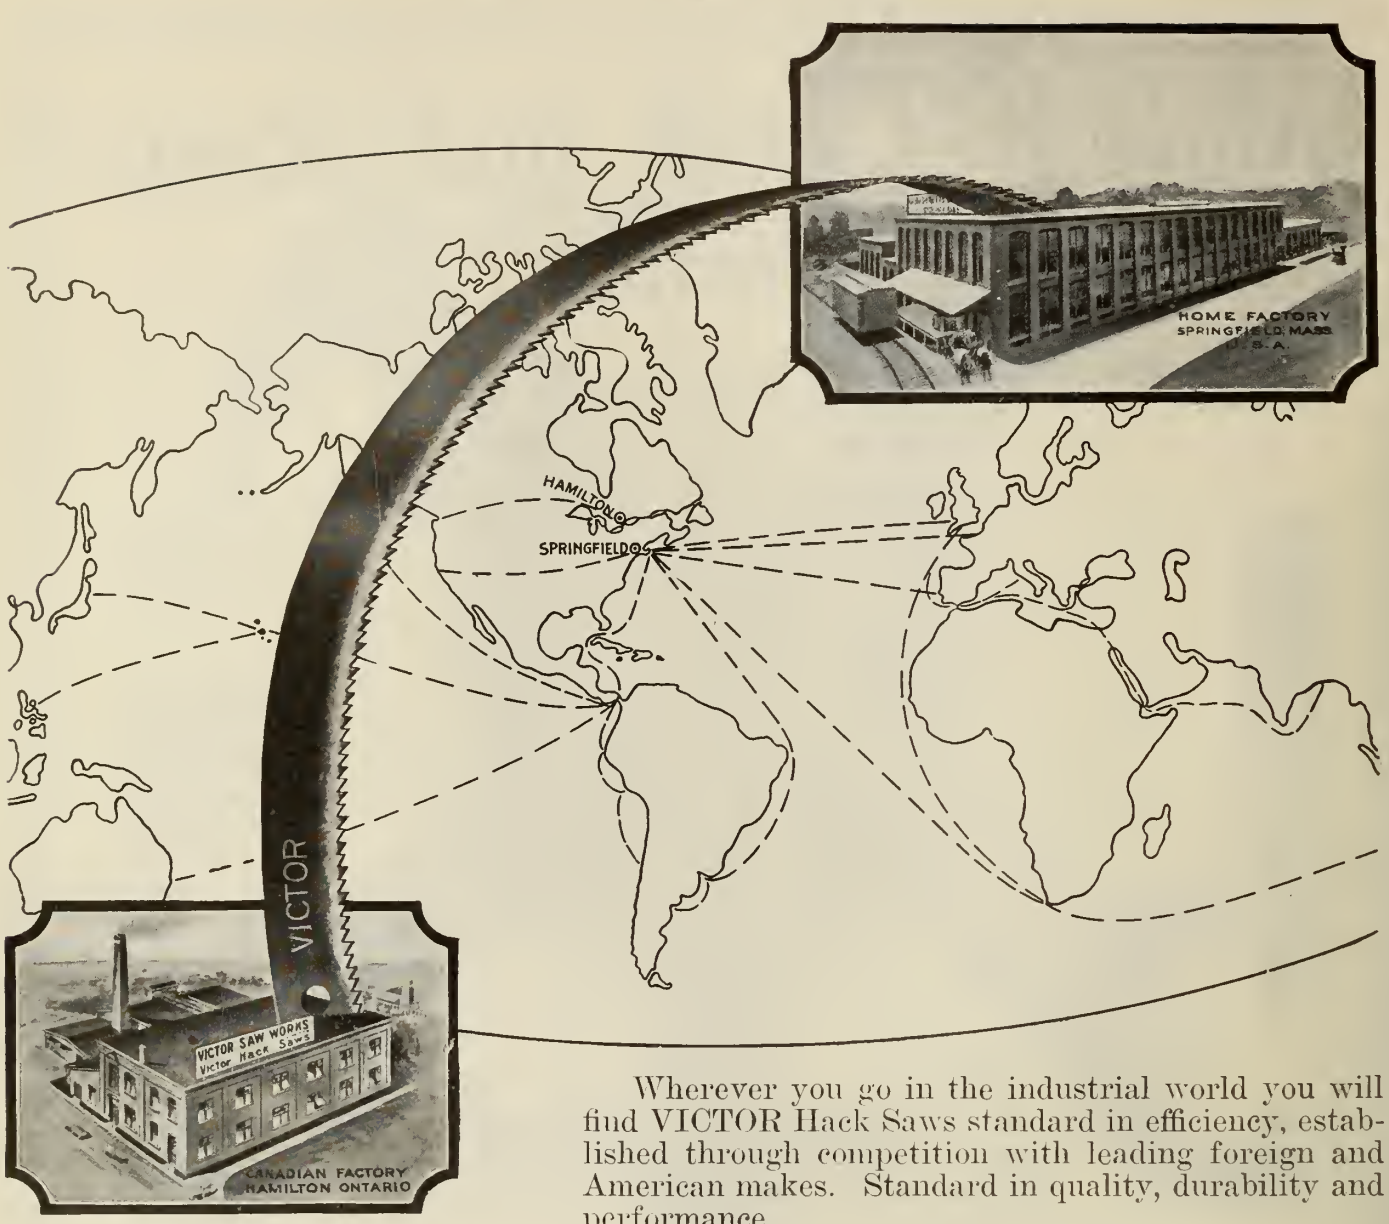
Place this gage in the hands of each machine operator and test the threads *as they come from the machine*

Too Slow

The *thread micrometer* is a good tool in its place, but it was never intended for a gage. It is *unsafe* as such, because *any* man is liable to misread it when both hands and "mike" are smeared with lard oil. And then there are vast differences for touch—hardly any two men get the same reading. As a manufacturer, you cannot afford to run that risk.

The *Ring Gage* is too *slow*. No machine operator has enough idle time in a bunch to run a thread in and out. Besides, a thread that was ten-thousandths too small in pitch diameter *might* fit the gage snugly because of error in lead, and the workman not know it. Look closely at the above sketch and note where the thread bearing comes.

But you can't fool these Wells Limit Gages



Send us an outline of your requirements.
We will return you a plan of gages needed for your output.
You will be surprised at the moderate installation cost.

They are entirely *adequate* for the purpose.
The weight of the screw governs the touch.
The human element is *eliminated*.
The workman is the inspector (that's economy).
There *is* no spoiled work (more economy).

Wells Brothers Company

Greenfield, Mass., U. S. A.

New York, 107 Lafayette St. Chicago, 568 W. Washington Blvd.

Wherever you go in the industrial world you will find VICTOR Hack Saws standard in efficiency, established through competition with leading foreign and American makes. Standard in quality, durability and performance.

A little higher in price than ordinary makes, but eight years of the hardest kind of tests in actual practice have proven that in the VICTOR you get more than you pay for.

VICTOR Hack Saws

Victor Flexible Hand Saws have all the qualities of an all-hard blade **except breakage.** Made of VICTOR special private-formula steel with flexible back and hard-cutting edge. Back is tough and strong, blade will bend, but not break, unless positively abused.

VICTOR Flexibles will last longer, do more work and do it quicker than any other flexible made. It is the best blade for hand-saw work.

We also make All-Hards for hand frames, but recommend the VICTOR Flexible. For power machines nothing equals the VICTOR all-hard.

All we ask is that you "get a box and try 'em." Look for the VICTOR sign at your dealers. It points the way out of your hack saw troubles. If he will not supply you with the VICTOR, write us and we will see that you get it.

Remember—there's a VICTOR for every purpose. If you are up against it on any of your work, we will gladly tell you which VICTOR to use for best results.

CATALOGUE AND PRICE ON REQUEST

STARRETT

What Is Your Hack Saw Problem?

Are you "up against it" in your shop on the hack-saw problem. Do your men complain about the saws breaking in the hand frames? Do you find that your power machines are too hard on the blades you're using? Do the teeth break out? Do the saws get dull too quickly? Do they give out under the strain put upon them by the high speed power hack saws that economical cutting to-day demands? We know that whatever your problem

A Starrett Hack Saw Will Solve It

because we have helped out so many others in the same way. There's a Starrett blade for every job. Some one of the full line of hack-saws is just what you need whether you're cutting sheet metal, or tubing or steel girders. Starrett Hacks are made of the best steel tempered by our own process. The teeth are cut right and the set is just enough to clear easily yet not enough to waste power and stock. That's why Starrett Hack Saws cut quick and last longer.

Catalog 203 contains some good saw information. May we send it?

Starrett Tools are sold at all good hardware stores.

How's this for a Smooth Thread?

Cut by the

Little Giant.

Canada's National Tap

Little Giant Taps receive a finishing or smoothing treatment unknown to ordinary taps. They cut easier. Take a microscope and see it. Try one on your work and feel it.

Smooth, clean threads are economical, and cannot be produced by a tap with rough, uneven, imperfectly formed teeth. The thread wall on the nut cannot be smoother than the cutting edge that made it.

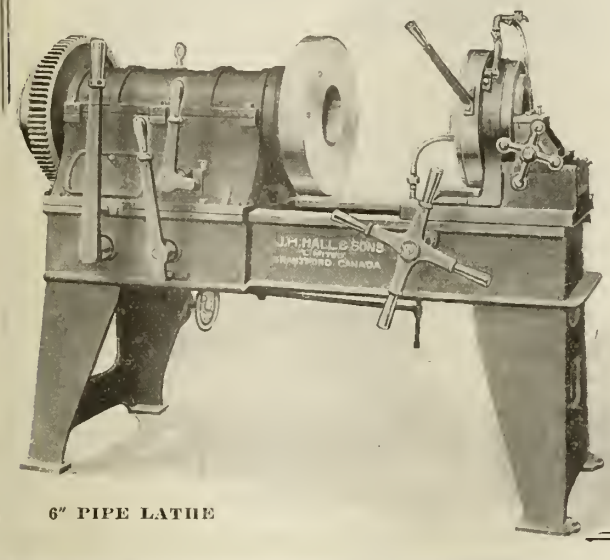
PRACTICAL BOOKS FOR PRACTICAL MEN



These books were written especially for practical self-instruction, by experts whose experience and standing make them authorities.
They are so clear that the beginner can understand them; so thorough that the trained worker can learn from them; so practical that they will give any man a working knowledge of the subjects that they treat, and save him both time and money.

They not only cover the fundamental principles of mechanical science, engineering practice, and business usage, but also present the latest developments and the accepted practice of the most successful men, in those lines.
They give men a practical knowledge of practical things, which enables them to think more accurately and to work more efficiently; and they compose the most helpful, reliable, and comprehensive series of **home study** books ever put upon the market.

ENGINEERS

THIS book deals largely with the foundation principles which govern the practice of steam engineering. Nothing so soon condemns the applicant as want of knowledge of the every day practice and simple laws relating to the care and management of a steam plant.

No one is expected to know everything, but all are required to be familiar with certain facts which may be called "the beginning of things."

The lack of knowledge of the small things carries conviction of the same lack in the larger.

Plain facts, that you should know, are plainly explained in AUDELS ANSWERS ON PRACTICAL ENGINEERING, answers your questions on

Air, Water, Steam, Fuel and Heat, Steam Boilers, Boiler Construction, Water Tube Boilers. The Steam Gauge, The Safety Valve, Properties of Steam, Installation of Boilers, Management of Boilers, Engineers' Law, Firemen's Law, Steam Engines, The Valve and Valve Gear, The Corliss Engine, Engine Arithmetic, Lubricators, Installation and Operation of Engines, Steam Pumps, Injectors, Feed Water Heaters, Steam Heating, Steam Traps, Belts, Gears and Pulleys, Steam Turbines, Refrigeration, Practical Electricity, Elevators.

Understand the framework of which your work is but a cross bar. Know something of the cause of which your work is but an effect. Know something of the effect of which your work is the cause. And, above all, know why it is done one way and not another.

LEARN THE THEORY UNDERLYING THE WORK

PRACTICAL ENGINEERING contains 288 pages fully illustrated, handsomely bound and printed, and is in every way a first-class book.

FREE (No Duty)
EXAMINATION

Sign and mail the coupon, and it will bring to your plant a book of sterling merit, for free examination. You can have one week in which to dig out valuable information contained in its 200 or more pages.

BLOWER DEPT

J-M FERRO COMPOUND

THE loss in scrapping and remelting defective castings, in every foundry and machine shop, is large. The greater part of this waste can be saved, at a very slight cost per casting, by the use of J-M Ferro Compound.

This is a chemical iron cement which, when mixed with water to form a stiff putty, smooths over and fills up blow holes, sand holes, etc., in iron and steel castings. Within a few hours after application, it metallizes and becomes a part of the casting. It makes a permanent repair and looks like the iron itself.

Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ... $1.00

PATTERN MAKING. By G. H. Willard. To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning; and all kinds of patterns. Price, postpaid .. $1.00

HOFFMANN Journal Bearings

have curved ball races, accurately ground and polished, in two hardened concentric rings of finest steel. The single row of balls run in an anti-friction cage of drawn gunmetal—or the bearings are filled with balls, without a cage, when required. The rings are ground absolutely true, so that the bearings can be readily and accurately aligned.

HOFFMANN Thrust Bearings

are undoubtedly the finest Ball Thrust Bearings ever put on the market. They are made single and double, to suit any requirements, and have been adopted as standard by the leading engineering and manufacturing firms the world over.

HOFFMANN Steel Balls

are the foundation of the superiority of Hoffmann Bearings. They are of the finest High Carbon Chrome Steel, with surfaces glass-hard and interiors somewhat softer. Each ball is guaranteed to be a perfect sphere, correct to standard size within one ten-thousandth of an inch.

Put your bearing problems up to us. Hoffman Ball Bearings have successfully carried loads up to 500,000 lbs., at speeds up to 30,000 revolutions per minute.

SAFETY FIRST

The railroads and many of the industries are strenuously pushing a campaign with the object of making SAFETY the FIRST and foremost thought among their employees.

The object is twofold: First for the protection of the men from a humane standpoint, and second, to prevent the disarrangement of the general routine of work through injury to workmen.

They are making changes in the methods of handling material, knowing only too well the risks taken when a mechanic attempts to adjust a heavy casting or move a piece of work which really requires mechanical aid.

You can totally eliminate this risk by installing

Ingersoll-Rand Air Hoists

to protect your men as well as yourselves.

They are built for accurate and quick adjustment of material or work; also for the safe and rapid transfer of castings, etc.

These Hoists are absolutely reliable in their operation. They combine Safety and Saving—one ton is raised five feet high, twenty-eight times for one cent.

If you feel enough interest in an economical method of handling material and incidentally protecting your employees write for catalog and circulars.

For Services Rendered

Practically every testimonial that we receive and publish is a grateful acknowledgment for relief given, and services rendered by MAGNOLIA METAL on troublesome bearings where other babbitts failed.

It is on such a firm foundation that our business is built here, there, everywhere.

E. K. WOOD LUMBER COMPANY

Los Angeles, Cal., May 2, 1913.

Dear Sirs:—

Kindly allow me to congratulate you on the quality of your metal, which has given me the most perfect satisfaction. About 18 months ago I placed in my mill a 30" x 6" high-speed planer (the top head speed 4100), 2 7-16" x 11" bearings. From the first this planer gave me a great deal of trouble The hearings burned out thirty days after I placed the machine in the mill. I hought a bahbitt at 42 cents a lb. (being good babbitt) and repaired the machine with it, hut with poor results (I am a mechanic of thirty-two years' experience). I then hought Copper Hardened Babbitt, which still did no good. On January 1st, 1913, I bought Magnolia Metal, and remetalled the bearings, and have been running ever since, eight and one-half hours out of the nine, and have had no trouble at all. Commenting upon the head 7" diameter, 30" length, with six knives and two 7-16" x 11" bearings, weight almost 900 lbs., in other words, 170% running balance, requires FIRST-CLASS BABBITT, and hereafter I shall use no other kind, for I must say, that Magnolia Babbitt gives perfect satisfaction.

Respectfully yours.

(Signed) L. EICHWALD, Mill Supt.,

"The Phantom of Fear"

The imagination when seized with Fear will create things more terrible than either sickness or hunger.

A few days ago a young man was selected to present a business proposition to a number of manufacturing firms located in a large industrial centre. He had just completed a "college education," came of a "good family,"—his father had made a success in business, and as far as we can judge raw human material, he measured up, in mentality and in character, above the average.

But in the Scheme of Life, the value of a man's ambitions is determined, the quality of his character is tested, and the fibre of the moral and mental courage that runs through his being is developed and strengthened, by coming in contact with the realities of life. No man can predict, with any degree of certainty, this thing or that of any other man until his sincerity has been called up for judgment before the Court of Experience.

After a preliminary training in New York City, this young man started on his first business trip; with all necessary information, money, opportunity, an unusual business proposition to place before his prospects and a fine position awaiting him as Assistant Manager of a Magazine, if he proved to be made of the right substance.

When the train pulled out from the Grand Central Station, facts, realities, verities and uncertainties came thudding through his brain. For the first time the threads of safety, certainty and security were severed. Day-dreams tottered and fell clattering one by one. College illusions and fancies were turned to for assistance, but these castles had crumbled to white ashes. Bubbles of conceit bursted and vanished,—the mirage had disappeared, and everywhere stood silhouetted the great black shadows of Reality—the necessity of dealing with life on the strength of his own courage.

WORK, a strange monster, with shapeless hands and stalking feet, confronted him at every turn. He planned to return home at the first station stop but did not have the courage—his entire being was frozen in a block of life's cold and rigid uncertainties. When he stepped from the train strangers were everywhere—humanity looked different than it ever had. He went to his room and retired at three o'clock in the afternoon. In a little while he arose and with trembling hands fumbled through his lists of business prospects, and each of these manufacturing firms had been transformed into a "phantom."

The next day he passed by the door of a few business houses but returned to the hotel without making a single call. In a little while he wired for money and when this came the fear of being forced to meet life on his own individual strength was temporarily relieved, but still the Night of Work hung about him like a dismal fog.

For twenty-two days he sat in the lobby of his hotel or turned restlessly in his bed, his mind constantly filled with the Phantom of Fear. Around every place of business he built, with his imagination, a wall filled with dark crevices in which lived the Ruminants, Owls, Bats and Dragons of Fear. On the evening of the twenty-second day he returned to New York City, pursued and beaten by a phantom—a thing that does not exist.

And the Phantom of Fear has forced the imagination to create all the ghosts and ghouls that ever haunted either the "grave-yard" or the courage of man.

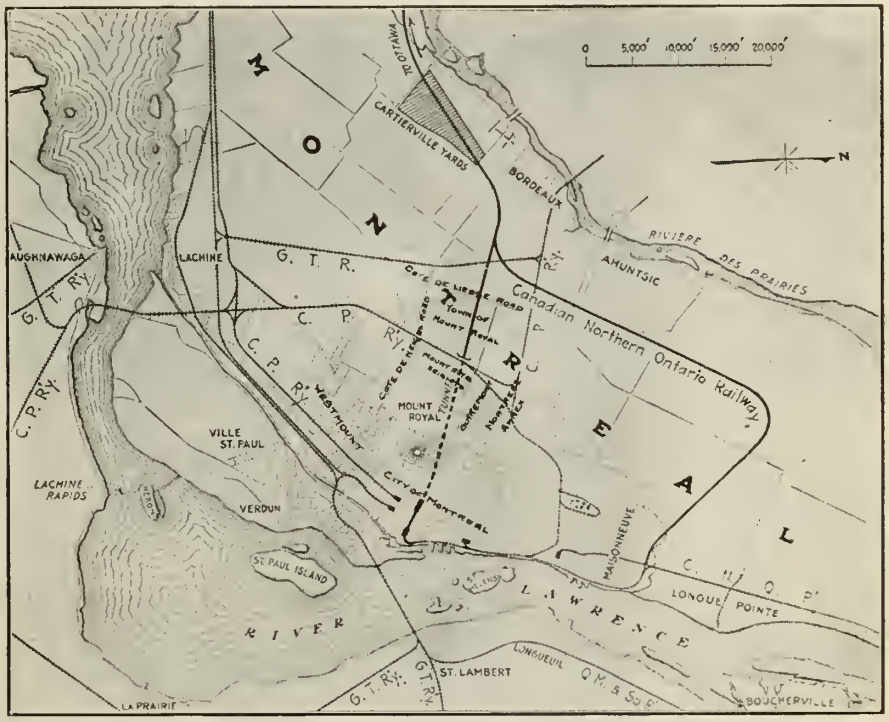
Mount Royal Tunnel, The Canadian Northern Railway

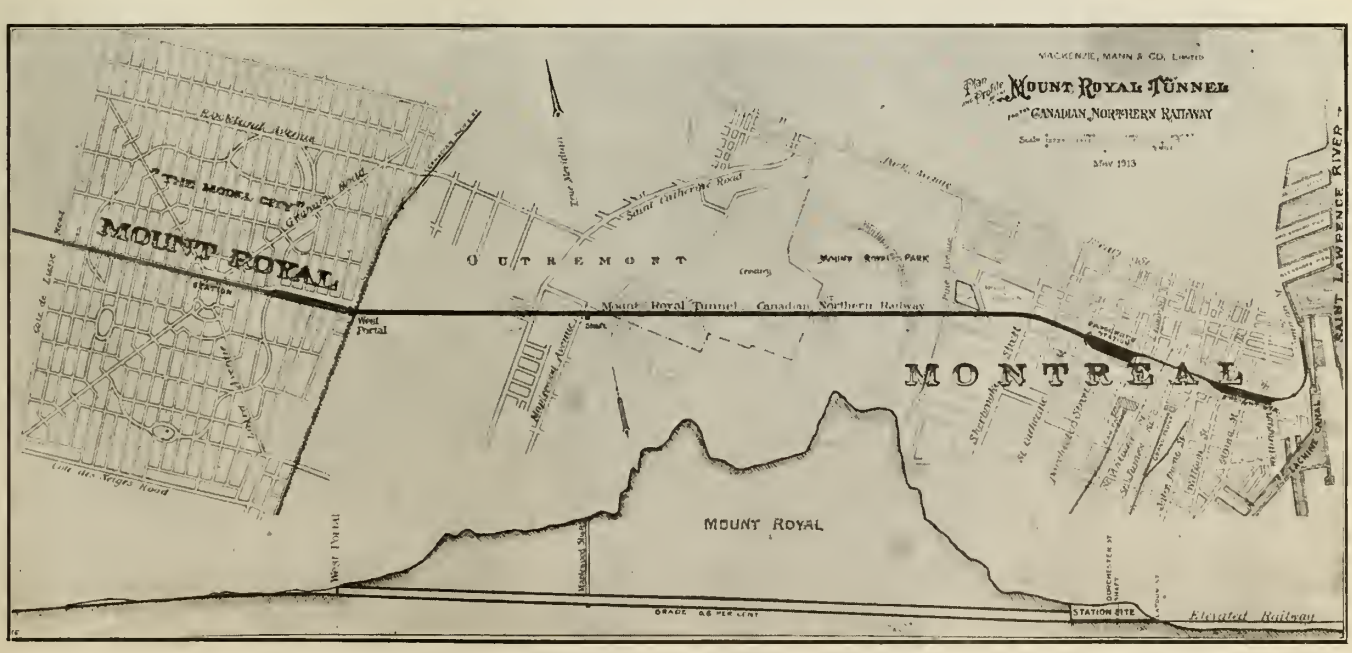
By J. C. K. Stuart*

The author deals in an interesting and comprehensive manner with this great undertaking, with which he has been connected from its commencement. The preliminary heading through the heart of the Mountain was completed on December 10, 1913, and work on the enlarging of the bore is now going rapidly forward. The various methods to be adopted in lining different sections of the tunnel are of considerable interest.—Editor.



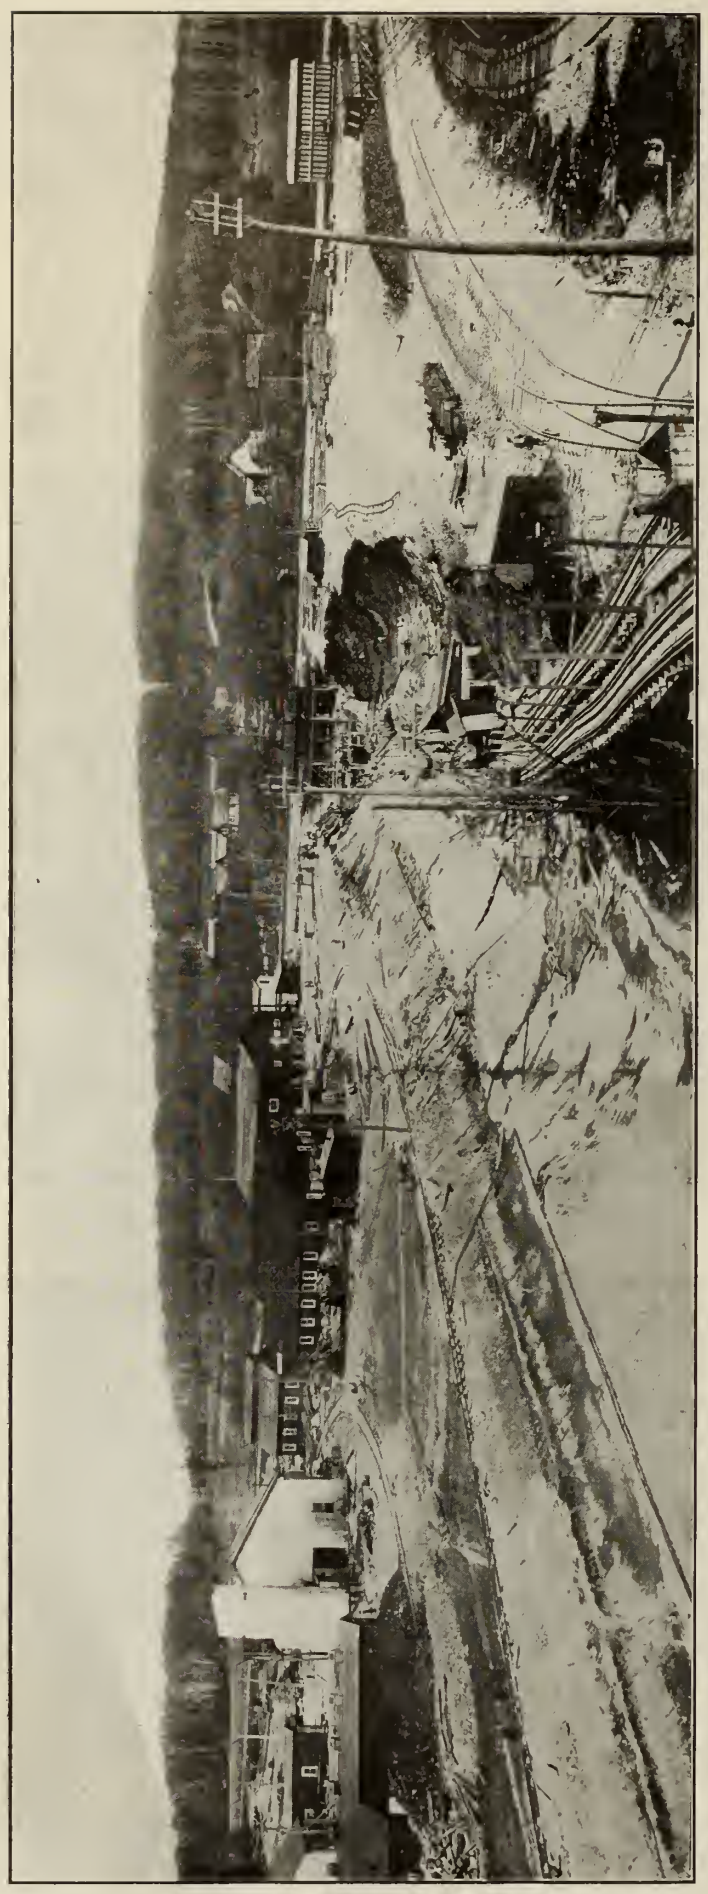
THE Canadian Northern will become a complete Transcontinental railway about September, 1914, when the Canadian Northern Pacific from Edmonton to the Pacific Coast and the Canadian Northern Ontario from Montreal to Port Arthur will be ready for operation.

The Montreal tunnel and terminal of this new Transcontinental is the largest work of the kind that has ever been undertaken in Canada. The railway and general situation in and around Montreal is clearly shown in the map, and the manner in which the city has expanded along the St. Lawrence River and out around the lower slopes of Mount Royal can readily be seen. This expansion has taken place in three directions only; Mount Royal forming a natural barrier to rapid extension in the fourth direction.



To enter the city from the west in a similar manner to the Grand Trunk and Canadian Pacific Railways would have entailed the enormous expense of a right-of-way through thickly populated and valuable property, with numerous street crossings and many other disadvantages, while the railway can easily be brought to the back of Mount Royal, to within three miles of the centre of Montreal, over a comparatively cheap right-of-way and by a tunnel through the mountain into the heart of the city.

Large tracts of farm land were bought, extending from the lower slopes of Mount Royal to the Riviere des Prairies, or Back River. A portion of this land, consisting of about 1,200 acres, was subdivided and incorporated as the Town of Mount Royal; more commonly known as "The Model City." The



*First Asst. Engineer, the Mount Royal Tunnel & Terminal Co., Ltd.

MAP OF C.N.R. TERMINAL LINES AT MONTREAL, SHOWING THE NEW LINE WITH TUNNEL UNDER MONTREAL TO A CENTRAL PASSENGER STATION.

PLAN AND PROFILE OF THE MOUNT ROYAL TUNNEL.

GENERAL PANORAMA, WEST PORTAL, MOUNT ROYAL TUNNEL
THE CANADIAN NORTHERN RAILWAY MONTREAL

railway will bring this land to within ten minutes of the middle of the city; so it is expected that it will more than pay for the tunnel and terminal.

The railway crosses on to the Island of Montreal near its western end, and follows the south shore of the Riviere des Prairies to Cartierville yard. This yard will be for the storage and sorting of freight, and will have adequate shops and auxiliaries to serve the terminal. It will also be the point of transfer from steam to electric traction, as the tunnel and terminal will all be operated electrically. From the Cartierville yard, the railway runs in an easterly direction across the Cote des Neiges Road, thence southerly across the Jacques Cartier Union Railway (G.T.R.) at grade, and through the new town of Mount Royal, the tracks being depressed sufficiently to allow the streets to be carried over them.

About 400 feet from the southern boundary of the Model City, the line curves a little to the east, and passes through the western portal of the tunnel, which will be on the north side of the C.P.R. (Belt Line) right-of-way. From the portal the line leads straight under the new subdivision (Mount Royal Heights), part of the town of Outremont, and Mount Royal itself, to a point under the McGill University campus. Thence, curving to the west it comes down McGill College avenue to Cathcart street and into the passenger station, which is bounded by Cathcart and Lagauchetiere streets, Ste. Monique and Mansfield streets.

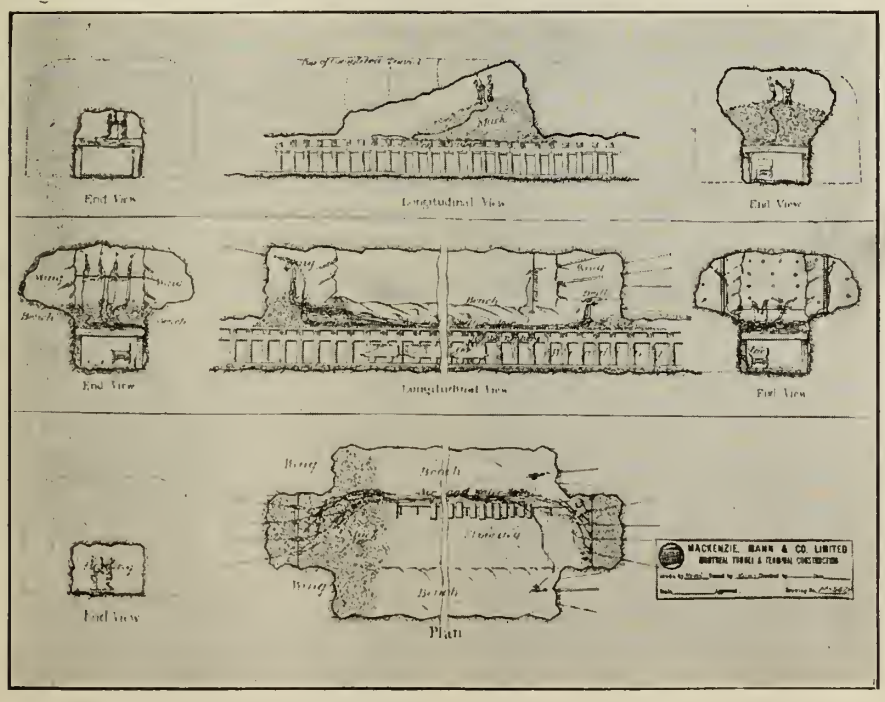
A glance at the profile illustration shows clearly the difference of elevation, amounting to about 72 feet, in the two levels of the city. The upper level comprises the shopping, hotel and residential districts, and the lower the wholesale and financial districts. The tracks in the passenger station will be about 50 feet below the upper level, and, from this station, the railway will run on a viaduct about 22 feet above the lower level to the river front, to connect with the Harbor Commissioners' proposed viaduct. This will give a connection to all the harbor facilities, the Canadian Northern Steamships and the Canadian Northern Quebec Railway at the east end of the city. As a part of the proposed viaduct across the lower level of the city there will be an elevated freight station in the centre of the commercial district for the receipt and delivery of local freight.

The tunnel is 3¼ miles long and descends on a six-tenths of one per cent. grade from the West Portal to the Terminal Station. It is designed for two tracks in two separate tubes. There will be a station at the centre of the Town of Mount Royal and another sta-

tion at the West Portal, with platforms extending under the C.P.R. tracks, forming an underground station for Mount Royal Heights. Multiple unit trains will run on a three-minute schedule within the electric zone to carry passengers from Cartierville, Mount Royal and Mount Royal Heights into and out of the city, thus bringing the latter two within seven minutes of the main station at Dorchester street. If elevated stations are built at the crossings of St. James, St. Antoine and Notre Dame streets, these two new subdivisions will be within ten or twelve minutes of the financial and commercial district.

The passenger station will have sufficient length of platform to accommodate the longest Transcontinental trains, and enough tracks will be provided to take care of, and separate the express and commuter traffic. The tracks being below the street level, the surface will be available for station and office buildings and it is expected that the terminal development will be self-supporting aside from the railway business. The platforms will be readily accessible by ramps from the upper level, and a driveway from the lower level. High platforms have been adopted,—that is to say, the platforms will be level with the floors of the cars, which will facilitate the handling of passengers during the rush hours.

Heading Progress.

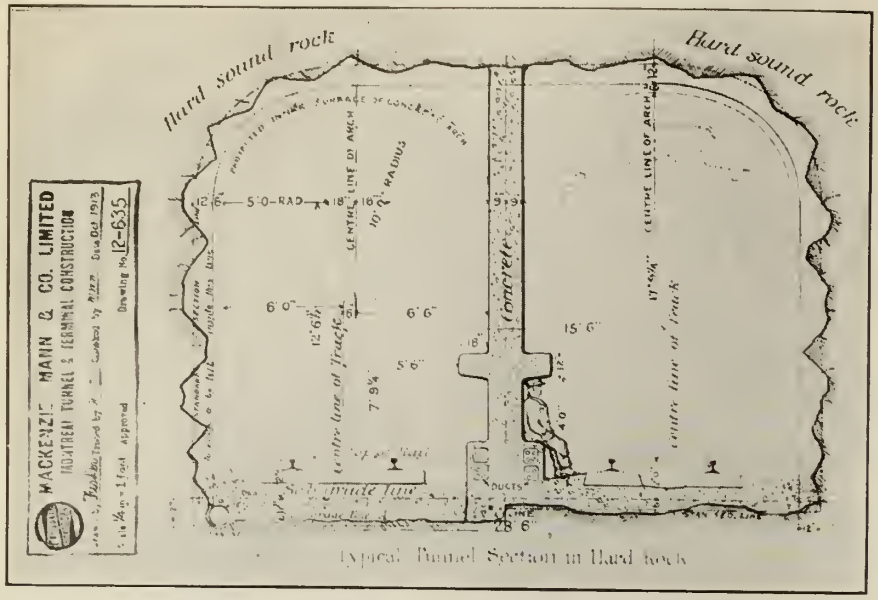


Mount Royal is supposed to be an extinct volcano, but it is doubtful if it ever was active, though it is the remains of a volcanic upheaval of igneous rock. There have evidently been several stages of upheaval, as both the limestone and the main igneous body of Essexite are broken and cut by a great many dikes of quite different character and probably of later origin.

A limestone of various degrees of hardness was the first rock to be met with; then, as the headings progressed dykes of quite different character and Bostonite, Camptonite and Syenite were encountered and a volcanic breccia, which was extremely blocky to drill and shoot. The heart of the mountain is Essexite, a very hard and tough rock.

The method of excavation adopted was the bottom centre heading, as this method allows the heading to be driven forward as rapidly as possible, without much regard for the character of the ground, and the full-sized excavation can be developed simultaneously in as many places as desired. The headings were driven large enough to permit the use of a double-track 3-ft. gauge railway through the "break-ups."

DRILLERS WORKING AT FACE OF HEADING.



BREAK-UP PROCEDURE.

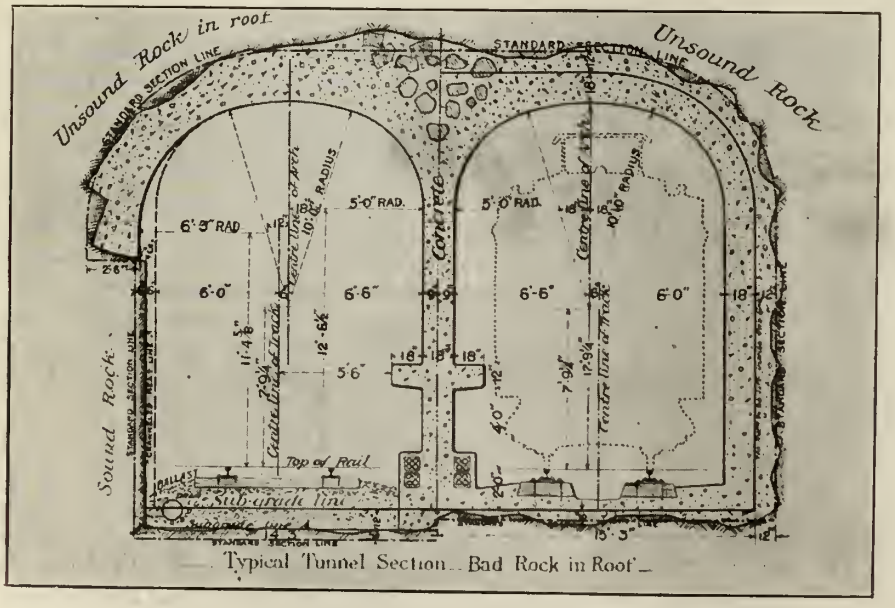
Work was commenced at the west end of the tunnel in May, 1912. An open cut was made down to the tunnel level and a bottom centre heading, 8 feet high by 12 feet wide, was started in July. This heading was driven in about 200 feet, through boulder clay, when ordinary crystalline limestone was struck. A shaft 240 feet deep was sunk near Maplewood avenue, about a mile from the West Portal, and headings were started, one west to meet the heading from the West Portal, and another east towards the city. At the city end, a shaft 55 feet deep was sunk near the corner of Dorchester and Ste. Monique streets, and a heading driven up under McGill College Avenue, and westward. The headings driving east from the West Portal and west from the Maplewood shaft met on April 5, 1913, and the headings east from the Maplewood shaft and west from the Dorchester shaft met on December 10, 1913.

The character of the rock has had a very great influence on the progress of the headings. The heading driven east from the West Portal was in limestone for the first 1,500 feet. As the men became more familiar with the methods of excavation adopted the progress in-

creased to about 22 feet per day, but when the breccia was encountered, the progress dropped to 9 to 12 feet per day.

TUNNEL CROSS SECTION IN HARD, SOUND ROCK, REQUIRING NO LINING.

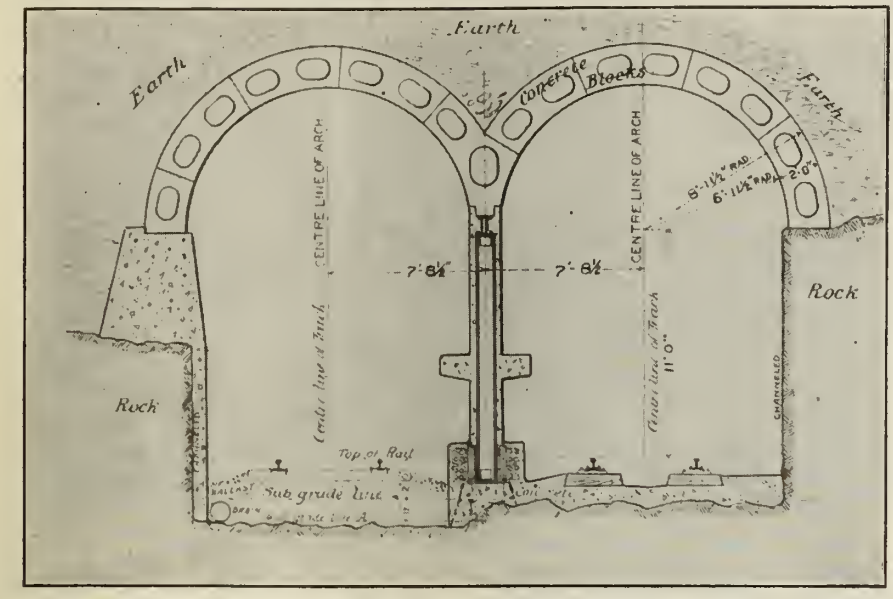
In the 10 ft. x 12.5 ft. heading driving east from the Maplewood shaft the progress averaged 343 feet per month from Dec. 1st, 1912, to March 31st, 1913, the greatest monthly progress in this period being 408 feet in December, 1912. The heading started from the shaft in November, 1912, in hard crystalline limestone, and as it advanced the rock became harder until the solid Essexite was encountered in January, 1913, when progress dropped to about 12 feet per day. The muck-handling drill carriage was installed in the following April, and the monthly progress increased to an average of 477 feet from May 1st to November 30, 1913, the greatest monthly progress in this heading being 510 feet in May.



At the city end, before the limestone became very hard and crystalline, the progress averaged about 20 feet per day, and during the month of April the heading advanced 507 feet. In May 810 feet of 8 ft x 10 ft heading was driven in 31 working days, and this is considered to be a new record in hard rock tunneling. At the beginning of May the heading was in crystalline limestone, but about the 20th of the month a good many dykes of hard trap rock were encountered, which reduced the progress considerably. About fifteen months elapsed between the start and completion of the heading in the tunnel proper. The heading is about 16,500 feet in length, and approximately 68,000 cubic yards of rock have been excavated from it.

Break-Up Excavation.

In January, 1913, the "break-ups" were started at the west end. The break-ups, i.e., the excavation of the upper part of the tunnel section to its full width and height, are opened at intervals of from 500 to 800 feet along the centre bottom heading. As many break-ups are opened as is possible, the number depending for economy on the amount and efficiency of the transportation plant. Speaking theoretically, as many break-ups may be opened as are necessary to keep pace with the heading progress, the advance in each break-up being about half that in the heading.



CRUSHER PLANT AND DISTRIBUTING SYSTEM, WEST PORTAL.

TYPICAL TUNNEL SECTION—BAD ROCK IN ROOF.

The roof of the heading is drilled and blasted down on to the track until there is sufficient room for the men to work above the heading. Jumbo timbers are then framed into the heading and planked over, forming a timber floor for the break-up and a timber roof for the heading. The break-ups are advanced by carrying an entry in both directions, the same width as the heading and the full height of the roof, about 15 feet ahead of the wing wall excavation. Four drills, mounted on a horizontal bar, are used in the entry. One drill mounted on a column is used in each wing. The six drills do all the drilling in both ends of the break-up, and two drilling shifts of

8 hours each break all the ground that three mucking shifts of 8 hours each can economically handle. When the drilling

TUNNEL CROSS SECTION IN SOFT GROUND REQUIRING SHIELD. O'ROURKE CONCRETE BLOCK LININGS.

in the entry and wings is finished the entry and wings are shot together; and while mucking is going on, the drills are set up in the other end of the break-up. The rock is all blasted down on to the timber floor. Cars are spotted underneath and the muck run directly into them through holes in the timber floor. This method makes the handling of the muck very cheap and rapid; and very little blasting powder is required as the rock is always breaking to two faces.

Approximately 97,000 cubic yards, or about 40 per cent. of the break-up excavation was completed during 1913, and it is expected that it will all be finished by May, 1914.

Bench Excavation.

After the break-ups are completed, the two side benches will be taken out by a steam shovel operated by compressed air. The benches will be drilled and blasted well in advance of the shovel and by using a specially designed boom, and dumping on to conveyors to carry the muck back to cars, very little time will be lost by the shovel.

Shield Work.

At the city end, where the floor and sides of the tunnel are in rock and the roof in earth, a roof shield will be used for the excavation, thus eliminating heavy and expensive timber work. The shield consists of a cutting edge, shaped to the outline of the tunnel roof cross section, forming the front of a steel envelope, extending over the platform on which the men work, and back far enough to lap over the last ring or section of tunnel being erected. The shield is supported on steel columns forming the centre wall and on side walls which rest on the solid rock. It is forced ahead by hydraulic jacks under a pressure of about 5,000 lbs. per sq. inch, which work against the tunnel lining as it is erected.

Tunnel Lining.

The tunnel lining will consist of concrete blocks weighing about two tons each, cast in large cast-iron forms and allowed to set in the yard for at least a month. These blocks are cast with two large tenons on one side and two recesses for the tenons on the other side, so that each block will lock firmly into the two adjoining blocks of the preceding ring. In this way no forms are required, and after a ring of blocks has been erected under the hood of the shield the jacks can force the shield ahead, as the excavation advances, until there is room to erect another ring of blocks, a space of about 27 inches being required.

The blocks are so designed that the extrados of the arch is continuous, but the joints in the intrados are about 1¼ inches wide. These joints are held to shape primarily by three part wedges, and later filled with concrete by means of a cement gun. The blocks will be handled into place by means of two hydraulic erectors on the shield itself. These blocks were invented and patented by John F. O'Rourke, a contractor of note in New York.

Pneumatic Concrete Lining.

Where the shield or other special construction is not used, it is proposed to try out the mixing and placing of concrete for the lining by compressed air. All forms will be collapsible and movable so that they may be used repeatedly. The concrete will be conveyed from the pneumatic mixer to the forms through pipes by compressed air. If this method is successful, it should be very rapid and economical.

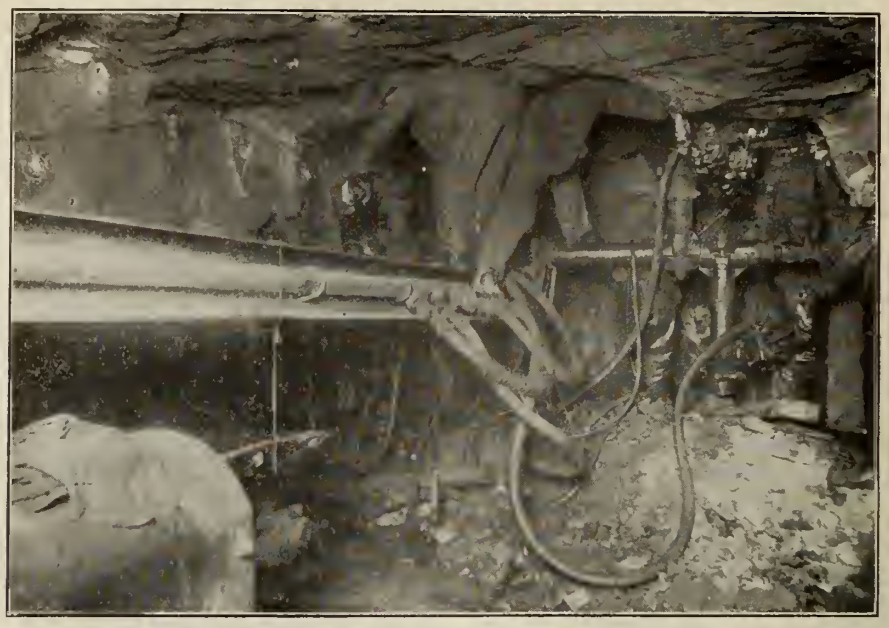
Tunnel Cross Sections.

The twin tube tunnel section was adopted for three reasons:

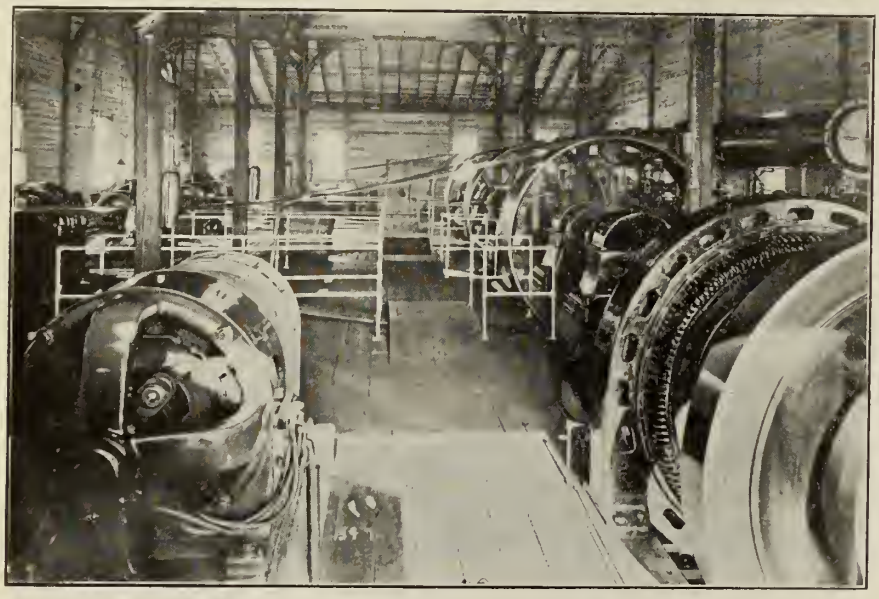
Economy in Construction.

Ventilation.

Safety of Operation.



VIEW OF A BREAK-UP, SHOWING TIMBERED HEADING BELOW.



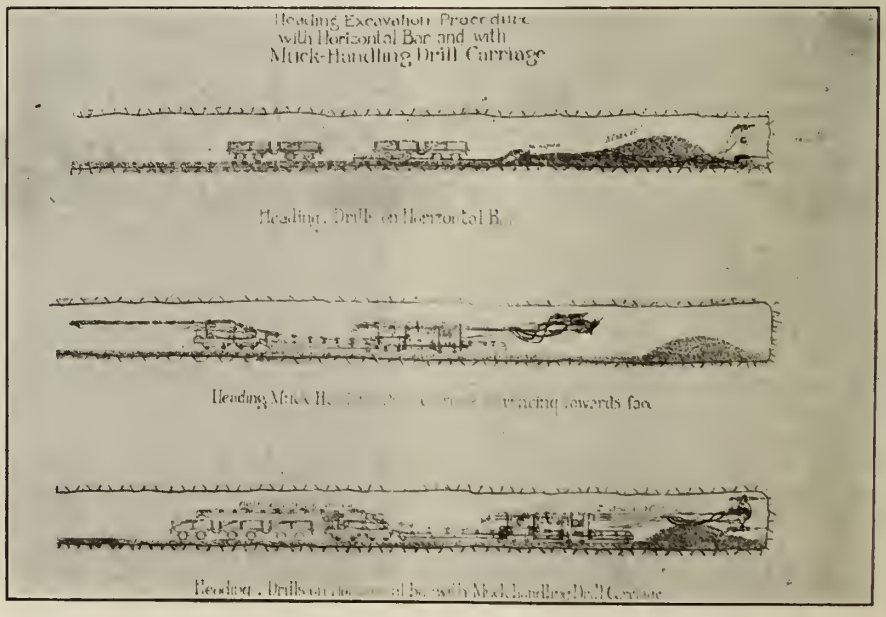
Economy in Construction.—It was found that in soft ground the amount of both excavation and masonry could be reduced by adopting the twin section. The geological formation indicates that a great portion of the tunnel will not need to be lined and that a concrete centre wall will sufficiently reinforce the natural flat rock roof.

Ventilation.—It is well-known that a twin tunnel with all the trains in each tube moving in a constant direction will be better ventilated than a double track tunnel, where passing trains merely tend to stir up the air without causing a continuous movement in one direction. The cross-section of each tube is so proportioned that the relation of train area to tube area will help ventilation without producing excessive compression, which would retard the speed of trains and be objectionable to passengers.

Since the headings have been "holed" and the air has been given clear passage through Mount Royal, there is a continuous current through the heading, its direction depending on the temperature outside.

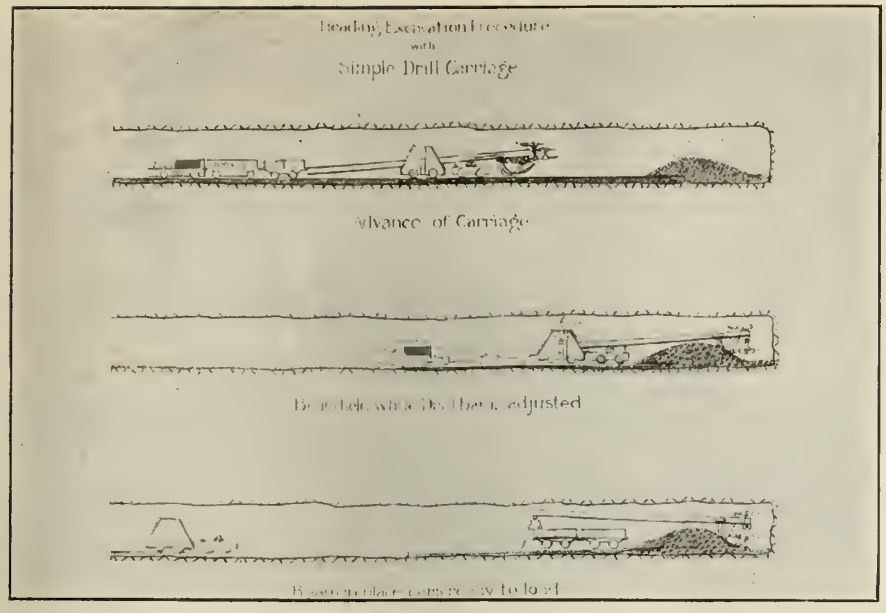
FRONT END OF MUCK-HANDLING DRILL CARRIAGE.

INTERIOR OF COMPRESSOR HOUSE, WEST PORTAL.



Safety in Operation.—The centre wall is particularly valuable in case of derailment or accident, as it confines the wrecked train to one track and leaves the other clear. The walkway at about the level of the platforms will allow passengers to get out of the cars in case of stoppage and walk to the nearest cross-passage and enter the other tube.

Underneath the walkway is a continuous refuge niche, except at splicing chambers, where trackmen may sit on the duct bench at the bottom of the centre wall and so be protected from passing trains. Large refuge niches will be built at intervals for the accommodation of hand cars and repair equipment during hours of train operation. The high headroom was adopted to allow room for a high voltage trolley, and the 3-centered arch to allow for the sway of the pantograph and because the stratification of the rock lends itself peculiarly to a flat roof.



The cross-section may vary materially in certain details, owing to local conditions. The concrete blocks and shield will only be used on the city end, where, in some few cases, flat roof construction may be adopted. Where the tunnel is all in rock and the sides are solid, but the roof bad, a single arch may be adopted, the centre wall being built up to the level of the walkway and provision made for constructing the remainder up to the arch roof, should the ventilation demand it.

Construction Plant.

All the rock excavated in the tunnel is being crushed for road material and concrete stone. What is not required by the company is sold in and around Montreal.

HEADING EXCAVATION PROCEDURE WITH HORIZONTAL BAR AND MUCK HANDLING DRILL CARRIAGE.

HEADING EXCAVATION PROCEDURE WITH SIMPLE DRILL CARRIAGE.

The main crusher plant at the West Portal, consists of two No. 7½ and one No. 4, Kennedy gyratory crushers, with Stevens Adamson elevators, conveyors and screens. The capacity is about 1,500 cubic yards per day.

The tunnel muck is hoisted in cars up an incline from the tunnel grade to the tipples above the two crushers. After the cars are dumped, they return by gravity to the tunnel level. The crushed rock is elevated to a revolving screen, which sorts it into various sizes and distributes it into bins. Cars can be run directly under the bins and loaded in a short time, and there is rail connection with both the C.P.R. and G.T.R. The excess of sorted stone is conveyed to stock piles and loaded as required by a locomotive crane with clam shell bucket. At the city end the tunnel muck is sold to, and crushed by, an outside company.

REAR END OF SIMPLE DRILL CARRIAGE, BEAM IN PLACE AND CARS READY TO LOAD.

O'ROURKE CONCRETE BLOCK ARCH SET UP IN SHOP.

Air Compressor Plant.

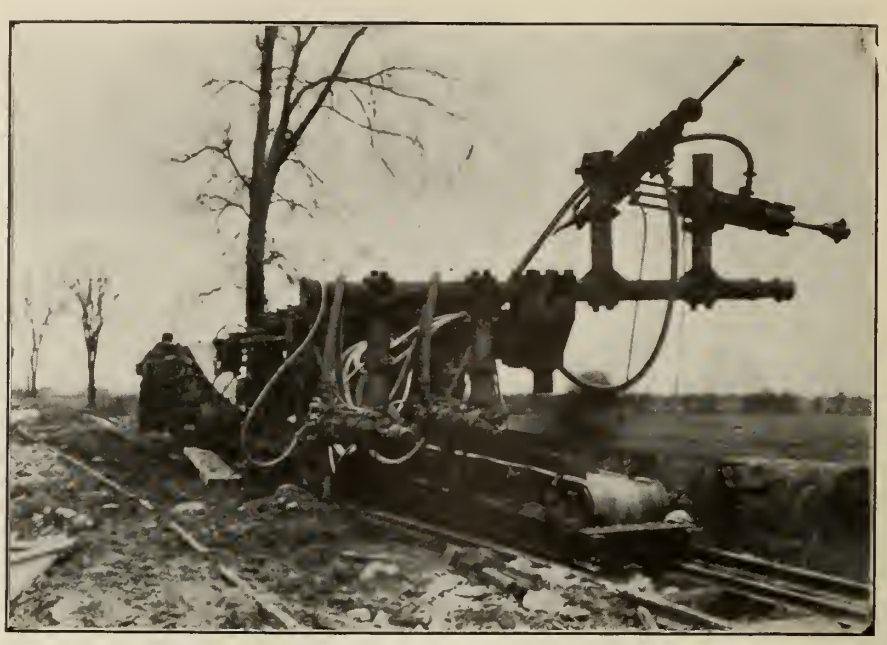
Compressed air is used to operate the drills, pumps, tipples, etc.; in fact, everything that is not operated electrically. There are two plants, located one at each end of the tunnel, with a total capacity of 11,000 cu. feet of free air per minute, compressed to 100 lbs. per sq. inch.

These plants consist of eight cross-compound compressors. Six of these are Blaisdell compressors of 1,100 cubic feet capacity each, belt-driven from 225 H.P. motors. The other two are Sullivan compressors direct connected to 400 H.P. motors, and of 2,200 cubic capacity each. Power is purchased from the Montreal Light, Heat & Power Co. at 2,400 volts, 60 cycles.

Well equipped machine, carpenter and blacksmith shops were built at the West Portal, so that the company would be independent of local shops for repairs. All the tunnel muck cars, the two drill carriages and two electric tunnel locomotives were built in these shops and several tunnel locomotives were converted from gasoline to electric storage battery. There are three Ward drill sharpeners, one at the east end, one at the west end, and one at the Maplewood shaft.

Transportation Plant.

The transportation plant consists of one 30-ton American saddle tank locomotive, standard gauge, for use in the yard; two G.E. 10-ton trolley locomotives, one G.E. 5-ton trolley locomotive; one converted 5-ton trolley locomotive; five 5-ton storage battery locomotives; two home-made 8-ton trolley locomotives, 215 tunnel cars of all types, all of 3-ft. gauge. There is the usual equipment of derricks and hoisting engines, together with one Browning 45-ton, 8-wheel locomotive crane; two Lidgerwood mine



hoists equipped with Eagle Iron Works automatic dumping shaft cages. There are also two gasoline motor trucks, one being a 7½-ton Commer and the other a 2-ton Alco.

Drilling Equipment.

The main drilling equipment consists of Sullivan reciprocating drills, fitted with a water attachment for hollow steel. There are three different sizes; FF 12, of 2⅝ inches dia.; FL 12, of 3¼ inches dia.; U.H. 2, of 3⅝ inches dia. The best light hammer drill being used is the Hardy Simplex. It is a 25-lb. self-rotating drill that has given most satisfactory service. Most of the drill steel used is F.J.A.B.

Four drills mounted on a horizontal bar were used in the heading. At the beginning of the job in the limestone, the F.F. 12 drills gave good satisfaction, but later, in the Essexite, they were considered too light to use with the ordinary crossbits, and the U.H. 2, 3⅝-in. and F.L. 12, 3¼-in. drills were substituted, with heavier horizontal bars. The 3⅝-in. drills weigh about 400 lbs. and the horizontal bar with its vertical columns, all the hose attachments, and the four drills, weighs several tons. All this equipment had to be handled in and out of the heading at each shot.

The muck handling drill carriage was designed to do away with this labor. It consisted of an I-beam cantilever, long enough to reach about 20 feet from the carriage over the muck pile, on the front end of which was carried the horizontal bar with all the drills mounted on their short columns and all the hose connections made from the drills to a manifold on the bar. This beam was carried on a heavy frame with two 4-wheel trucks underneath it, and so supported in the frame that it could be given motion transversely, vertically and longitudinally by means of electric motors. Underneath this beam was a continuous belt conveyor that projected out in front of the drill carriage frame far enough to allow the muck to be shovelled on to the belt. The conveyor ran to the rear and was elevated on a second carriage which allowed it to be carried over and dump its muck into cars underneath. A 10-H.P. Dake air motor, located on the second carriage, operated the conveyor.

FRONT END OF MUCK-HANDLING DRILL CARRIAGE.

The carriage was run on a 3-ft. gauge track on the left side of the heading, and as soon as the blasting was finished the muckers started in to clear the track, throwing the muck mostly over to the right side of the heading. When the track was cleared sufficiently (to within 15 to 20 feet of the face), the drill carriage was pushed in by a storage battery locomotive, until the horizontal bar was in the proper position, when it was blocked and jacked out against the sides of the heading. One air hose was connected to the drilling manifold, the other to the conveyor engine and drilling and mucking commenced. When the drilling and mucking were finished, the hose was disconnected, the horizontal bar was released and swung sideways, the carriage pulled back about 300 feet from the face by a locomotive and the blasting begun.

It was found that the drill carriages did not save a very great amount of time in setting up the drills, but they did save a great deal of labor for the drill runners, who were fresher and able to work to better advantage. The weight of the I-beam and the mass of the drill carriage behind it steadied the horizontal bar and helped the drilling progress a great deal. A simplified drill carriage was used in the heading going west from Dorchester Street. This machine had no conveyor for handling the muck from the front of the machine to the cars in the rear. Two trucks were used, coupled together to carry the I-beams, bar, drills, etc. The complete machine was pushed into the heading by a locomotive and the bar swung into position by hand and jacked tight. While the drills were getting ready to start work the trucks were pulled back, the I-beam sliding on the roller on the front truck, until it cleared the rear truck. It was then jacked up to the roof and a gallows frame support placed under it, clear of the track. The trucks were hauled out of the way and the muck cars run in under the beam. When the drilling was completed, the proceedings were reversed and the I-beam and its equipment placed on the

Power Driven Forging and Stamping Plant Improvement

By Wilfrid Spencer

The subject matter of this article consists of an account of a plant which, for a number of years, has occupied the author's attention, and took the form of a paper read recently before the Rugby Engineering Society.

WITH increasing standardization of parts of machines and tools, there had been an increasing need for some process by which parts having the essential properties of forgings could be reproduced in large numbers with an accuracy and neatness of finish. Especially has this been felt in such branches as the making of railway wagon parts, firearms, cutlery, etc.

Drop Forging.

Drop forging or stamping in dies has supplied this need, for it is possible to manufacture identical pieces in large numbers, with great accuracy; and the work turned out possesses the properties of forgings. The result of the adoption of this process has been twofold. In the first place, it has made the standardization of forgings possible, and in the second place, it has led to a perfection of design in some forms of machinery that could never have been reached otherwise.

In the case of motor-car engineering for example, where fewness of the parts is a desirable feature, the necessary complication in the shape of the parts could not have been attained by the old methods of forging, without making the weight excessive. By means of stamping, lightness and strength can be secured together with the needful complexity of form.

Economy of Stamping.

The economy of stamping, especially when large numbers of the same article have to be made, is very marked. In the first place, the stamping can be made very much more cheaply than a corresponding forging, even when the cost of the dies is considered, and secondly, the cost of finishing a stamped article is often very small. By means of stamping, the article can be made more accurately to size than by forging, thus largely reducing the amount of machine work which has to be put in at a later stage, and, in some cases, the finish from the dies is sufficient to obviate the necessity of machining altogether, as in the case of cranks and levers for railway signals, etc.

Brett steam stamps are easily controlled, and have found great favor. They have a large range of sizes from 3 cwt. to 7 tons falling weight. There is, however, one serious criticism that has been made against them—namely, that they are costly in steam consumption. This criticism has been so far warranted in the past that it must be at once admitted that they are not efficient engines, but the defect has been very largely met by an improvement brought out by the firm with which the writer is connected. The stamp has been fitted with a valve gear, the object of which is to cut off the supply of steam at about two-thirds of the stroke, allowing the remainder of the stroke to take place under the expansive action of the steam. The large "blow through" of steam on holding-up is avoided by the use of this gear, and it is estimated that the saving in steam consumption resulting from this and from using the steam expansively is from 25 per cent. to 30 per cent. Besides making the steam drop stamp an economical tool, this automatic expansion valve gear greatly improves the control.

Double-acting Steam Stamps.

Double-acting steam stamps, which were also described by the author, are provided with a piston and piston-rod similar to those of a steam hammer, and steam is admitted alternately to the top and bottom sides of the piston. The pressure of steam on the downstroke allows of a shorter stroke in these stamps compared with those in which the blow is given under the influence of gravity only, and consequently a greater number of blows can be struck in a certain time. In some special cases this is of great importance, enabling the requisite number of blows to be given and the article to be finished, while the maximum of heat still remains in the stamping. These stamps are arranged to give self-acting blows, the intensity of which can be controlled by the foot-lever.

Friction Drop Stamps.

Modern tendencies, however, are in the direction of adopting motor or gas engine drives, instead of steam, and, in an increasing number of workshops, steam boilers have been replaced by electric or gas engine plant. This fact has led hammer makers to design power-driven hammers and stamps. In seeking a power-driven substitute for steam drop stamps, the nicety and ease of control and the large range of size of the latter must be borne in mind. Obviously such tools as the kick stamp and board drop stamp, although of use in certain branches, could not fulfil the uses of a steam drop stamp. The need has been met by a friction-lifter, patented and made for some years by B. & S. Massey, Ltd.

Power.

The nominal weight of the stamp indicates the actual weight of the tup with the smallest die, but the maximum power required and the strength needed in the various parts depend on the weight of the tup with the heaviest die. In cases in which it is necessary to use exceptionally heavy dies, the weight of the tup should be reduced, or the size of the lifter increased, so that the total weight lifted is not greater than the maximum for which the lifter is designed.

When two or more stamps are arranged in a battery driven from one source, it may safely be assumed that the power needed will be less than the sum of the powers for the separate stamps by a percentage depending on the number of the stamps. To obtain the power required, add together the powers for the separate stamps and multiply by a factor, as follows:—

For two stamps, .84; three stamps, .7; four stamps, .58; five stamps, .47.

If, however, by this method of reckoning a higher power be obtained for part of the battery than for the whole of it, then the higher figure should be taken. If higher or lower lifting speeds are required, the power figures must be adjusted accordingly. The average consumption will only be a fraction of the power required for continuous lifting.

Motor Feature.

Motors should be capable of giving at half-hour rating the maximum powers calculated according to instructions above. For any good motor the output on half-hour rating will be from 33 to 55 per cent. larger than that on continuous rating.

Compound wound motors are recommended for driving stamps or hammer, since they run at a lower speed as the load increases, and are able to stand sudden fluctuations of load. They should be arranged to speed up 20 per cent. between the maximum load calculated from the lifting powers given in the table and one-sixth of this load.

Shunt motors may also be used, but they should be 15 per cent. more powerful, as they do not stand fluctuations of load so well. Alternating current motors may be used either of the short-circuited rotor or wound rotor type.

Motors should preferably be of the enclosed ventilated type, as they are subject to the dust of the stamping shop.

Forging Hammers.

Turning to a consideration of forging hammers, we shall find the same causes

at work tending to develop electric or gas driving at the expense of steam, and it will be necessary to mention, in passing, the use of compressed air for hammer driving. The advances made in gas and electric driving have brought compressed air into greater prominence, and it has gained favor with a number of power users.

There are cases in which the use of compressed air in the smithy or forge is right, as, for example, where compressed air is used for other purposes, such as riveting, chipping, and caulking, or where steam would have to be carried such long distances as to be unprofitable, owing to the large condensation losses. These considerations, added to the undoubted advantages of compressed air in working, have led to its substitution for steam in hammer-driving in many cases.

Where such a change has been made, it has sometimes been found possible to retain the steam hammers and drive them by compressed air, but the great objection to air driving is its cost. In most cases the production of compressed air involves an expensive plant which requires a great deal of power to drive. Attempts have been made to use the air economically by means of a number of different systems, but some of these have only met with partial success, while others have involved a complication in design without resulting in economy.

Amongst other systems adopted, attempts have been made to apply the principle of compounding to the case of compressed air. Now the whole reason for adopting compounding in the case of steam is that the higher pressures of steam are obtained at a very small additional expenditure of fuel. By means of compounding it is possible to take advantage of these high pressures, by expanding the steam in two or more cylinders, and so largely increasing the output of the engine at a very small extra cost.

In the case of steam hammers, therefore, there is a theoretical advantage in adopting compound cylinders, though there are practical difficulties, such as the weakening of the piston rod, etc., which limit its practical advantages. In cases of air, however, there is nothing to be gained by the adoption of such a system. Every increase of pressure in compressed air requires a proportionately extra expenditure of power to create it, and higher pressure involves greater leakage, and heavier losses from the dissipation of the heat of compression. The theoretical gain due to compounding in the case of steam has no parallel in the case of air, in which higher pressures require proportionately more power, and when applied to the design of hammers, involves a wanton complication of parts, and is a mere waste of power.

Choice of Pressure.

In air driving, the choice of a suitable pressure is of more importance than is generally realized. While it may sometimes be necessary to drive hammers by high pressure air, where a compressor plant is already installed for driving pneumatic hand tools, no advantage is gained by its use for forging hammers, and its use is always costly. The lowest pressure compatible with reasonable dimensions of cylinder and all-round convenience should be adopted. The best pressure to use is 45 lb. per sq. in., and a low rate of expansion may be used, say, 2 to 1.

In a steam engine the clearance losses are reduced by arranging that the piston shall approach very near to the cylinder cover at each end of its stroke, and that the passages between the valve and the cylinder shall be as short as possible. In the case of a hammer this can be done to some extent at the top of the cylinder, but at the bottom there is necessarily a very large clearance owing to the thickness of work being dealt with. There is, therefore, a very heavy clearance loss in such a case, if air is alternately admitted to and exhausted from the lower side of the piston. Also, since the hammer falls with very great velocity, which increases as it descends, a considerable "back pressure" is created in forcing the air out from the lower part of the cylinder through passages which must of necessity be small.

In the Massey patent compressed air hammer, both these sources of loss are eliminated, by arranging that the lower side of the piston shall be constantly submitted to an air pressure tending to lift the hammer; air being alternately admitted to and exhausted from the upper side only.

This allows of the air passage to the lower side, and the clearance at the bottom of the cylinder, being as large as is desirable, without entailing waste. The effective pressure on the down stroke is a differential one, due to the difference in area between the top side of the piston and the annulus round the piston rod on the bottom side. This difference is kept as great as possible by making the annulus just sufficiently large to allow an easy rise of the piston after the blow has been struck, and by making the rod or ram of very large diameter. A very important feature of this hammer is that it uses the air expansively. This action is absolutely automatic, and is attained without the use of any valve gear.

Pneumatic Power Hammers.

The criticisms that have been made with regard to hammers driven by compressed air, do not, however, apply to hammers in which the motive power is a shaft, or a direct coupled electric motor. There are types of power-driven hammers which are no more costly to run than steam hammers under average conditions, while in many cases, where power is cheap, they may cost very much less.

The fact that many of these hammers are known as pneumatic power hammers needs a word of explanation. Confusion has sometimes arisen between the "compressed air hammer" which is driven by compressed air from an external supply—in the same way as a steam hammer is driven by steam—and the "pneumatic power hammer" which is a belt or electric driven machine. The latter has its own pump which compresses the air and uses it as a medium, by which the unvarying and inelastic motion of the shaft and crank is transformed into an elastic blow, the length of which can be varied at will.

The pneumatic hammer has passed through various stages, and it is not the purpose of the writer to deal with forms which have been superseded. He will deal more especially with the types of hammer mostly produced at the present time. These will all be found to be similar in one respect—namely, in the possession of two cylinders, in one of which a pump piston reciprocates, while the other contains the hammer piston and rod. The systems differ, however, in the distribution and action of the air which forms the connecting link between the two moving parts.

Suction Lifter Pneumatic Hammers.

In some cases the hammer piston is raised by suction and thrown down by pressure, alternately formed above it by the reciprocating pump piston. The objections to such a system are, firstly, that the suction can only amount to a very few pounds per sq. in., since, even when the vacuum is greatest, there must still be enough air present to give the pressure for throwing down when the pump reverses; conversely, the pressure for throwing down can only be low, else the suction on the return stroke would be too feeble to lift at all. Again, there must be an interval between the time when effective lifting force ceases and effective depressing force begins, and vice versa.

It follows that in such hammers the lifting and depressing forces are necessarily small, and only act for part of the stroke, and, therefore, that the tup can only be light in proportion to the cylinder diameter—it is sometimes only a hollow casting—and that the action is feeble and slow. Clearly such hammers cannot be regarded as satisfactory substitutes for steam hammers, in which the tup is both lifted and thrown down by pressure.

The characteristics of the steam hammer blow can only be reproduced by a tool which employs the motive fluid in

the same way in which a steam hammer does. That is to say, in order to find a satisfactory power-driven substitute for the steam hammer, it is necessary to look for one in which both the rise and fall of the hammer piston are accomplished by pressure.

Method of Driving.

Pneumatic power hammers may be driven either by a belt from a line shaft, or by a direct coupled electric motor. The chief advantages of the direct electric drive are:

(1)—Hammers so arranged can be placed anywhere without reference to the position of engines, shafting, etc., and can thus often be used to greater advantage than when the choice of position is restricted to places where a belt-drive exists, or one could be conveniently installed.

(2)—The absence of belts enables cranes to be used over, and on all sides of the hammer.

(3)—There is no loss of power when the hammer is not working, as is the case when heavy shafting and belting is kept running continuously. In direct motor drives the motors can be stopped when the hammers are not in use.

(4)—A single hammer can be used when the rest of the machinery is standing, which is a great convenience in the case of a special job having to be pushed forward by overtime or night work.

(5)—Where special conditions require the speed to be varied from time to time, this can be accomplished electrically.

LOCATING LOSSES IN BELT TRANSMISSION.

By C. T. R.

THE factory superintendent who knows his business is constantly seeking new ways of overcoming loss of power in belt drives. Every belt in a factory drops some power which has been paid for but never received at the final point of application. This loss may run from a nominal amount up to fully half of the actual power delivered at the drive pulley. Efficient production demands that this loss be reduced to a minimum. How to do it is an important study.

Given pulleys of the correct diameter and width, and the proper speed for the machine in question, the greatest loss occurs through slipping or binding of the belt. Dry, hard belts running over slippery pulleys either waste a vast amount of power through slipping, or they have to be drawn so tight that they waste a correspondingly great amount of power through friction. Belts should be run loose and they should be kept in such a natural soft condition that they grip the pulley surfaces firmly without the use of sticky belt dressing.

There is another point where a great loss of efficiency occurs and this is at the joint or lacing, for unless the joint be smooth and flexible, it requires considerable extra power to drive it over the pulleys. A stiff joint works like a street car with a flat wheel, and a joint with an offset or bump on the pulley side may be compared to a wagon wheel passing over a stone on a smooth pavement. Both produce a jerk and both use up unnecessary power.

It has long been known that belts laced with leather lacing are open to the latter criticism, and, furthermore, leather lacings break oftener and take much longer to do than the modern steel lacings. A good steel lacing is superior to leather lacing in durability and saving of time, but the character of the steel lacing should be carefully investigated before a choice is made. The metal lacing must be strong and it must be as flexible as the belt itself. It should be quick and simple in application, proof against rust and corrosion, and the points of the metal which enter the end of the belt should be so made that they divide the strain evenly and do not cut off any of the belt fibres, for this weakens the belt.

Some metal belt lacings have been very severely condemned by safety authorities because the prongs work loose and catch the clothing or hands of the machine operators, yet this cannot occur where these prongs point back toward the end of the belt and are sunk in flush with the surface.

MY FUTURE—A CREED.

By H. F. Frasse.

I KNOW that my future depends upon myself, because the manner in which I perform the duties assigned me will determine my value.

I shall always give a heaping measure, that my pay may be in proportion to the service I render.

It shall be my aim to work for, talk for, and boost my employer, because I am one of the organization.

Under no circumstances shall I listen to or take part in discussion affecting hurtfully the welfare of my employer.

STAFF OF STEAM BOILER BRANCH, DEPT. PUBLIC WORKS, PROVINCE OF ONTARIO. READING FROM LEFT TO RIGHT:
D. M. Medcalf, Chief Inspector.
G. Guillet, Clerk and Bookkeeper. W. H. Bradt, Inspector. T. J. Main Inspector.
G. Drummond, Inspector. A. Brown, Inspector. W. Burns, Inspector.

I believe that every man will find if he look carefully into his own work that he has an undiscovered character for good; as well as that he possesses loyal service to give his employer.

I know there is no substitute for thorough-going, ardent and sincere earnestness, nor does it come of its own volition. It must be considered and made positive in each man's mind.

I am convinced that one man is better than another according to the quality, more than the quantity, of work he performs.

I shall always be cheerful with my associates and outsiders, because cheerfulness is contagious, lightens the work and brings credit to my concern.

Light hidden under a bushel is seen by no one, hence is of no value in making comparisons.

I shall let my light so shine that all men may see my good work and benefit thereby.—N.E.L.A. Bulletin.

WEDGES, SCREWS AND SCREW JACKS.

By H. Womersley.

THE wedge is a double inclined plane, hence when two bodies are forced asunder by its means in a direction parallel to its head, by multiplying the resistance by half the thickness of the head or wedge back, and dividing the product by the length of one of the inclined sides; the quotient is the force equal to the resistance.

Example.—The breadth of the back or head of the wedge being 3 in., and its inclined sides 10 in., required the power necessary to act upon the wedge to separate the substances whose resisting force is 150 lbs.

$$\frac{150 \times 1.5}{10} = 22.5 \text{ lbs.}$$

When only one of the bodies is moveable, the whole breadth of the wedge is taken as the multiplier, and the following rules are for such wedges acting under pressure on the head of the wedge only.

To find the tranverse resistance to the wedge or weight; multiply the power by the length of wedge, and divide by the breadth of the head.

To find the power: multiply the weight or tranverse resistance by the breadth of the head, and divide by the length of the wedge.

To find the length of wedge; multiply the weight by the breadth of the wedge, and divide by the power.

To find breadth of wedge: multiply the power by the length of the wedge and divide by the weight.

The Screw.

The screw in principle is that of an inclined plane wound around a cylinder which generates a spiral of uniform inclination; each revolution producing a rise equal to the pitch of screw. The pitch being the height or angle of inclination, and the circumference the length of plane, when a lever is not applied; but a lever being a necessary qualification of the screw, the circle which it describes is taken, instead of the screw circumference as the length of the plane; hence the mechanical advantage—as the circumference of the circle described by the lever where the power is applied is to the pitch of the screw, so is the force to the resistance.

Example I.—Required the effective power obtained by a screw ⅞ in. pitch, and moved by a force equal to 50 lbs. at the extremity of a lever 30 in. long.

$$\frac{30 \times 2 \times 3.1416 \times 50}{.875} = 10760 \text{ lbs.}$$

Example II.—Required the power necessary to overcome a resistance equal to 7,000 lbs. by a screw 1¼ in. pitch and moved by a lever 25 in. long.

$$\frac{7000 \times 1.25}{25 \times 2 \times 3.1416} = 55.73 \text{ lbs.}$$

The Screw Jack.

To find the weight a screw jack is capable of lifting, the screw being ½-in. pitch, radius of handle 30 in. and force applied 40 lbs.:

$$\frac{40 \times 30 \times 2 \times 3.1416}{.5} = 15{,}080 \text{ lbs.}$$

CANADA'S EXPORT TRADE.

DURING the month of December, according to figures issued by the Department of Customs, the exports of Canada underwent a remarkable increase. The exports of domestic produce during December, 1913, amounted to $55,803,642, as against $38,658,625 in December, 1912, the increase thus being $17,145,017, or 44 per cent. By far the largest item in the total was the export of agricultural products, which stood at $35,367,942, as against $22,859,325 in the corresponding month of 1912, the increase being a trifle over $12,500,000, or nearly 55 per cent.

Manufactures.

There also was a heavy proportionate increase in the export of manufactures, the figures being $5,599,086, as against $3,800,805, the increase being within a few dollars of $1,800,000, or more than 47 per cent. There was also a heavy increase in animals and their produce, the figures standing at $4,744,056, as against $2,791,550, the increase being $1,952,506, or nearly 70 per cent.

During the nine months' period ending December 31, 1913, the exports coming under the head of agriculture showed an increase of about 50 per cent. over those of the corresponding period of 1912. They stood at $177,706,169 in the latter, as against $119,209,170 in the earlier period, the increase being $58,696,999.

Substantial Increase.

Animals and their produce also showed a substantial increase, from $36,740,883 to $43,568,859. There also was a ten-million-dollar increase in the exports of manufactures, from $31,160,289 in 1912 to $41,478,454 in 1913.

The products of the fisheries have shown a marked and consistent increase. For the nine months' period they rose from $12,180,323 to $16,080,950, while for the month of December the increase was still more marked, the exports being $2,524,487 in last December, as against $1,680,499 in the corresponding month of 1912. The imports for consumption in December were $45,004,552, as against $51,142,509 in December, 1912.

There was a heavy importation of coin and bullion during December amounting to $7,567,279, as against $607,551 in December, 1912.

BOILER EXPLOSION FROM METAL FATIGUE.

ACCORDING to Engineering News, a vertical water-tube boiler exploded in the generating station of the Richmond Light and Railway Co. at Livingston, United States, as a result of which six men were killed and four others injured. The boiler, which was one of a bank of three installed in 1901, was blown through the roof of the station. The other boilers in the bank were uninjured except for damage to the brickwork. The boiler had been washed out on the day of the accident and put into service ten minutes before the explosion took place. The failure occurred in the bottom head, and, according to our contemporary, was due to fatigue of the metal at the point where the head was flanged up to join the drum.

MOUNT ROYAL TUNNEL.

(Continued from page 108.)

trucks and hauled back about 300 feet from the face.

Estimated Quantities.

An idea of the magnitude of the undertaking may be gained from the following estimated quantities:

Tunnel.

Excavation, earth .. 20,000 cubic yards.
Rock ....405,000 cubic yards.
Concrete .... 50,000 cubic yards.
Steel and iron ....4,400,000 lbs.

Terminal Site—Exclusive of Buildings.

Excavation, earth ..540,000 cubic yards.
Rock .... 95,000 cubic yards.
Concrete in retaining walls, slabs and platforms.....100,000 cubic yards.
Reinforcing steel .....3,500,000 lbs.
Structural steel .....8,000,000 lbs.

Organization.

Mackenzie, Mann & Co., Ltd., are doing the work, and as they are also the principals in the Canadian Northern Railway, the organization covering both design and construction is as follows:

S. P. Brown, managing engineer for Mackenzie, Mann & Co., Ltd., and chief engineer of The Canadian Northern, Montreal Tunnel and Terminal Co., Ltd.

W. C. Lancaster, electrical and mechanical engineer;

H. D. Robinson, engineer of design;

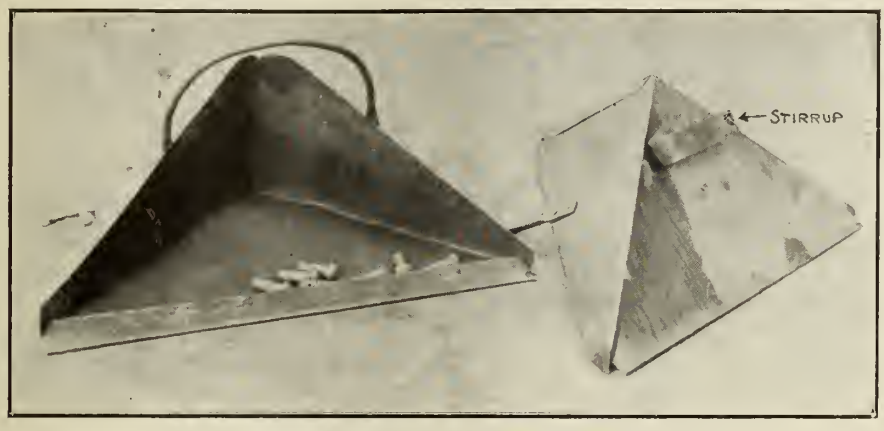
H. T. Fisher, tunnel engineer;

Richard Byers, general superintendent Western Division;

Edward Duffy, general superintendent Eastern Division;

R. T. Gent, master electrician and mechanic;

J. C. K. Stuart, first assistant engineer.



MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

A HANDY CATCH BOX FOR RIVETS.

By J. H. W.

THE catch box for rivets here illustrated is used in the new steel car shop of the Canadian Pacific Railway at Montreal. The stationary rivet furnaces are at present arranged along one side of the building, necessitating the throwing of the rivets some little distance in the case of cars being built on the opposite side of the shop. The box is placed in a convenient position near the work and in a line with the furnace; and rivet boys quickly become expert at throwing the rivets across the floor into the box.

HANDY CATCH BOX FOR RIVETS.

The latter is formed from one plate, with a single vertical riveted joint at the back lap. A stirrup is attached to the bottom by four machine screws, and a light handle is provided for carrying the box around. The stirrup raises the box from the floor and thus prevents the heat of the rivets from damaging the latter, which in this shop is of a mastic composition. The stirrup of course gives the bottom of the box a slope towards the front, but the rivets are prevented from rolling out onto the floor by the flanged lip on the front edge. This lip has a triangular section for the sake of stiffness, and this form also serves to prevent rivets from jamming at the front. The illustration shows a front and back view.

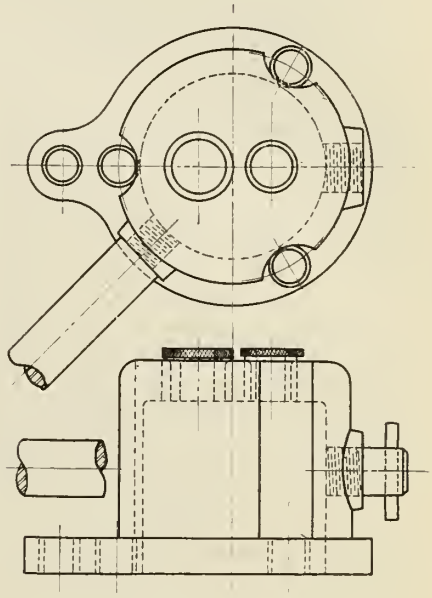
SHOP HELPS.

By E. W. Tate.

THE following means of preventing work attached to the face plate from slipping, without undue tension being put on the holding down bolts, have been tried and their success proven:—

(1)—Packing tissue paper between work and face plate.

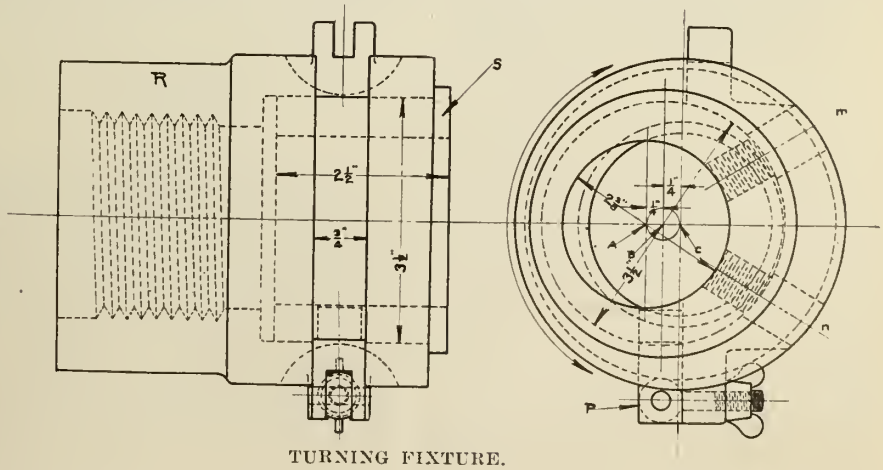
(2)—Applying evenly a coating of oil and fine emery between work and face plate.



(3)—Applying a thin coating of hot shellac to the side of the work which will be placed next to the face plate, and also to the face plate after it has been removed from the lathe. The work should be quickly put on the face plate, then moved around so as to evenly distribute the shellac. A weight should next be placed on it, and allowed to remain until the shellac sets. For thin work, and of not too large diameter, clamp bolts will not be required.

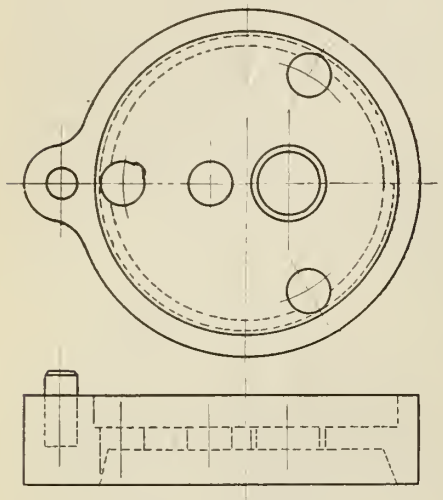
JIG AND FIXTURE FOR IGNITER BODY.

By D. O. Barrett.



THE igniter body shown in the cut is used on several sizes of a line of gasoline engines. The casting is finished all over and the pressure maintained in the cylinder by the bevelled ground joint near the inner end. The 7-16 in. hole is merely drilled for a 5-16 in. stationary electrode, being countersunk at the ends for a number of 11-16 in. mica washers, which are used for insulation. The ⅜ in. hole is reamed for the movable electrode.

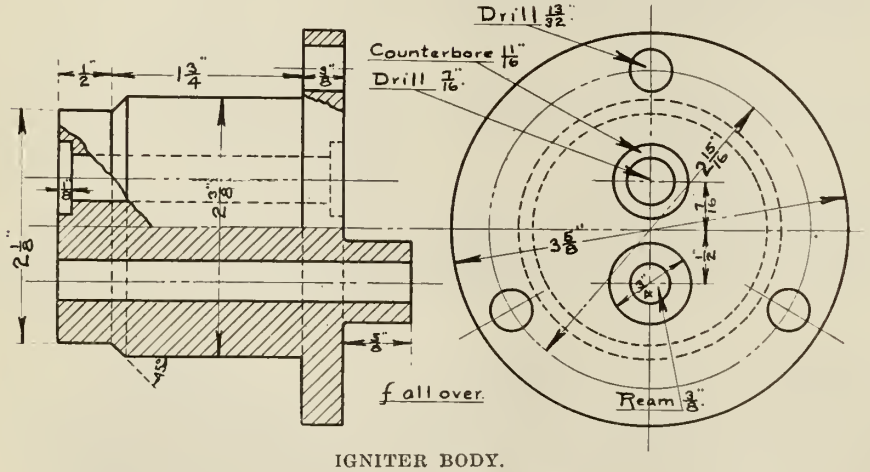
The rough casting is grasped by the flange in a 3-jaw universal chuck, being pushed against shoulders so that no trueing up is necessary. The body of the casting and the inner face of the flange are then turned, after which there remains the turning of the post and the flange and the facing of the outer end. It will be noticed that the post is ½ in. off centre.



DRILL JIG.

The casting is next slipped in the turning fixture and held by the headless set screws (m) and (n). The body (R) of the fixture is screwed on the lathe spindle. This is bored out to 3½ in. to

TURNING FIXTURE.



accommodate the sleeve (S), the hole being one-fourth inch off centre, or one-half the distance of the igniter post off centre. The sleeve (S) is inserted in the body (R) and carries a 5/8 in. x 3/4 in. steel post at one side, which is pressed in after the sleeve is in position. This post is slotted for the clamping screw,

DRILL JIG BASE.

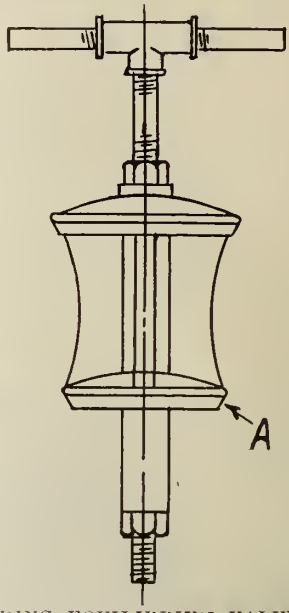
which is provided with a wing nut. A slot is milled across the main casting (R) so that the sleeve (S) can be turned through one-half revolution, the steel post (P) being brought against the casting and serving for indexing purposes. The lug on each side is milled through for the clamping screw.

The post (P) is turned to the upper side, and the sleeve bored out 2 3/8 in. to hold the igniter body. This hole is now 1/4 in. off the centre of the sleeve, but

IGNITER BODY.

is at the centre of the lathe spindle when the post is at the top, and is 1/2 in. off the centre of the spindle when the post is at the bottom, as shown in the drawing. The centre of the lathe spindle is indicated at (C); (B) is the centre of the sleeve (S); and (A) is the centre of the 2 3/8 in. hole for the igniter body. In the position shown, the igniter body is inserted and the post brought as near the centre as possible by lining up roughly with the tail centre which is run up. Considerable stock is left on this post, as in casting quite a lot of difficulty was experienced with shrinkage troubles.

After being turned to size, the piece is laid in the drill jig base, the post dropping through the hardened bushing in same. The drill jig is then set down over the casting, the 3/8 in. pin in the base entering the bushing in the bottom of the jig. This automatically puts the jig in the proper relation both to the base and to the piece to be drilled. The screw at the side of the jig is then tightened. This jig is handled by the cold rolled steel handle projecting from the side.



The jig is held by the handle while all the holes are being drilled, reamed and counterbored. After all the operations are finished with the jig in position shown, it is lifted off the base and inverted, to allow the counterboring on the outer end being done, this finishing the piece. Loose bushings are provided for the 3/8 in. and 7-16 in. drills. These pieces were handled in remarkably quick time, as there was no clamping to be done, all locating being accomplished automatically.

GRINDING EQUILIBRIUM VALVES.

By R. Bell.

VALVES of the equilibrium type, as used for locomotive throttle valves, also for bye-pass valves on locomotive steam chests, and for many other purposes, require great care to be exercised when being ground in. Unless this is done the valve will almost invariably leak at the smaller face (A). The general procedure is to grind the valve in by the usual method, using emery and oil on the faces and revolving by hand or other means until an apparently good bearing is obtained on both faces. The main difficulty seems to be the ability to determine when these are both O.K. The best means of finding out is to grind until no movement can be felt in either end of the valve when it is placed in its seat and the handle by which it has been ground shaken gently. Before doing so, all emery must be removed from both faces.

I find after grinding in the usual way, and then applying this test, the valve

GRINDING EQUILIBRIUM VALVES.

will almost always be found to shake a little at the small end. There being less area there, it seems to grind away a little more. The usual test of cleaning off the grinding material and revolving the clean faces together to show up the bearing is unsatisfactory, as the bearing will show good on the small face, due to the bottom end of the valve wobbling, and thus picking up a bearing. When one end is found to move, the remedy is to grind the opposite end, and very little will be found sufficient, as a very small movement can easily be detected. The sketch shows a locomotive throttle valve, with a suitable handle for grinding, made of pipe fittings in position.

THE FAULT ON BOTH SIDES.

By N. G. Near.

"ALWAYS follow the blue prints, John, and don't take anybody's word for anything. For making this bull we'll have to dock you three dollars this week, because it was an expensive mistake. I hate to do it, but them's the orders, and it's for the good of you and the Company. Let this be a lesson to you. I made the same error once myself, and they soaked me for it, too." Thus spake the foreman to a machinist who had disregarded the blue print dimension for the inside shell diameter of a fan casing. The foreman had previously talked to the machinist about a change in design, and had told him that the diameter of the fan was going to be changed, and that the bore of the casing

at the position of the fan would be changed from 26 in. to 28 inches. John had misunderstood the foreman. He thought the foreman wanted the casing he was working on bored to 28 in., so he went ahead and cut it to that size without asking any questions, in spite of the fact that the blue print before him specified 26 inches very distinctly. Hence the "call."

Of course the casing wasn't ruined. It was repaired by casting a ring, turning down, and press-fitting it into place. Doubtless the Company who purchased the fan never noticed the patch.

John, however, was sore. He knew very well that the three dollars he was docked was not enough to cover the loss to his employers, still he was peeved and was lying low for an opportunity to get even with the foreman. So one day, while John was boring out a 12-in. cylinder, in which a packing ring was shown and dimensioned in the blue print, the foreman came around and told John that the superintendent had told him (the foreman) that a special cylinder was wanted, with the packing ring omitted. Therefore, the packing groove should be omitted out of this cylinder.

John listened patiently and said nothing. He now saw his opportunity to get even—just what he had been looking for—and the groove was turned in the cylinder as per blue print.

FIG. 1

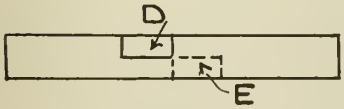


FIG. 4

SPLITTING GAS ENGINE PISTON RINGS.

When the foreman discovered the "error" he was furious. He called John names that could never be printed, and thereat John unloaded a few of his own thoughts that he had been storing in his mind since the time he was docked three dollars. "A couple of weeks ago," he said, "you told me to always follow blue prints and not to take anybody's word for anything. That's exactly what I have done, and now you say I'm wrong again. How the devil am I to know what is right?"

Being up against the type of foreman who would reason with no man when angry, John was discharged on the spot. He did not leave, however, until he had filled the shop with a pretty choice selection of cuss words.

It is clear that both were wrong. In the first place, the foreman should not have said, "Don't take anybody's word for anything." He should have given the man credit for having a little common sense. No man likes to be a machine. Any ambitious man craves responsibility. In the second place, John should not have turned the groove in the cylinder. The reason why it was not wanted was perfectly clear to him. He had turned the groove out of sheer stubbornness, knowing all the while that he would be reprimanded for it.

It is impractical to run everything systematically; therefore, we should be careful in making rules, and instead of reprimanding a man severely, rather advise and reason with him, and give him credit for being a human being and show him that you are his friend.

METHOD OF SPLITTING GAS ENGINE PISTON RINGS.

By R. Bell.

IN a works manufacturing small power gasoline engines, workshop methods were of a very primitive nature; a case in point being the splitting of piston rings. These were split, as shown in Fig. 1, and were cut by means of a hacksaw,

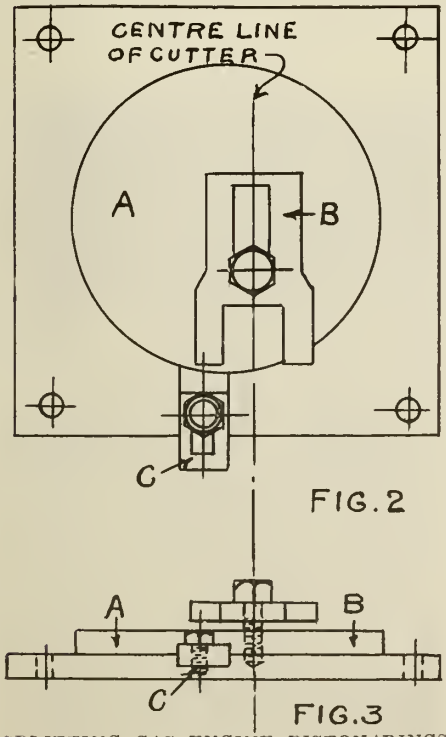

FIG. 2

FIG. 3

SPLITTING GAS ENGINE PISTON RINGS.

½ in. being cut out to give the rings the desired amount of spring. The operation of cutting a ring and fitting it into the mandrel jig took about fifteen minutes.

The following method was introduced by which seven rings could be cut ready for use in fifteen minutes. A jig, as shown in Figs. 2 and 3, was made to fix on the milling machine table. The centre part (A) was made to allow the rings to slip on easily. When in position, the ring was held by the clamp (B), the point of which was split to allow a ½-in. milling cutter to pass into it. The spindle of the machine was adjusted for height, so that when a cut was run through a ring, it took exactly half the ring, as shown at (D) Fig. 4. A big number of rings were cut on one side.

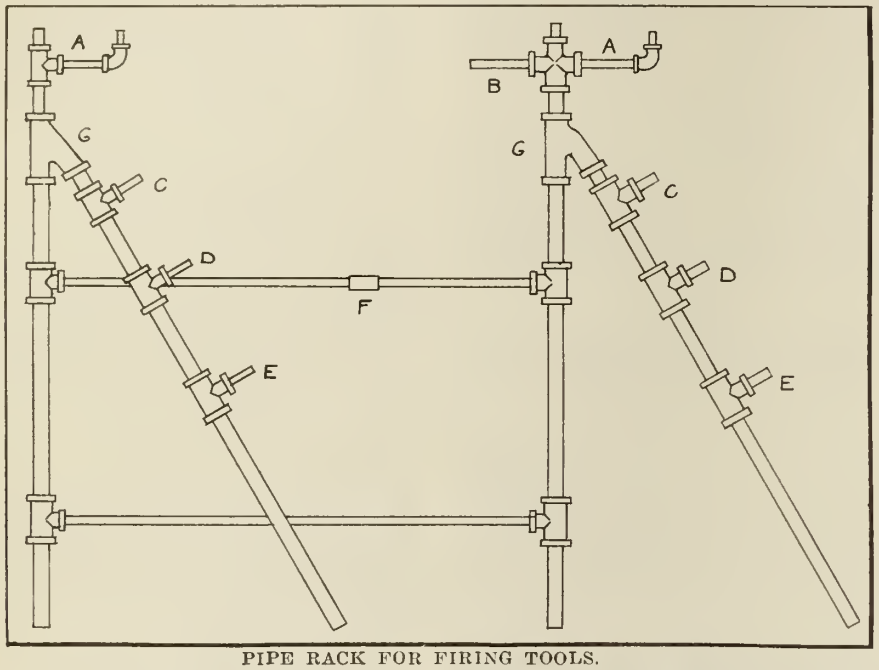
The second operation of cutting the other side was next performed. To do this accurately and quickly, a feather (C), Fig. 2, was provided, the edge of the cutter just coinciding with the edge of this feather. During the first operation this feather was kept back, but on starting the second, it was moved forward against the edge of the centre part (A). The cut part (D) of the rings was placed over this feather, and a cut taken through the other side, as shown by the dotted lines at (E), Fig. 4.

With accurate adjustments this just split the rings, and left them ready to put on the mandrel for turning to cylinder diameter. The result was a big saving in time as well as in saw blades.

CONCERNING BELT SPEEDS.

By W. E. Mason.

I WISH to secure such information as will allow me to solve some belt speed problems. We had a chain drive enclosed in a case and the chain ran in oil. The pulley diameters were 15 in. and 4½ in. respectively, but we could not get the speed required, namely 2,000 r.p.m.



The chain drive made more noise than anyone could believe, and after three weeks running, the chain snapped and the case was damaged beyond repair, one of the parts of the chain embedding itself 1½ inches in a brick wall, 30 ft. from the pulleys. We did away with the chain drive after that experience and installed belting with larger pulleys. The engine room is comparatively quiet now, although there is still room for improvement. I want to know the speed of the belt in feet per minute, and to get the rule for ascertaining belt speeds. Do you think the speed is too fast? If so, what will be the remedy. The belt is double cut square, laced, and 8 in. wide.

To intelligently answer the foregoing, the diameter of the belt pulleys should be given.—Ed.

PIPE RACK FOR FIRING TOOLS.

By J. E. N.

THERE have been some curious and wonderful arrangements made and used from old pipe fittings and scrap pipe. Here is another one, and which I am told is new. It is made from one inch pipe screwed tightly into the fittings shown, and is used to hold the rake, hoe and other firing tools on the spikes (C) (D) and (E). If the fireman is the lucky owner of an extra slice bar or other tool, he can place it ready for

PIPE RACK FOR FIRING TOOLS.

business in case one of his regular kit gets broken, on the arms shown at (A), and if he has an extra shovel he can hang it on bar (B). The coupling at (F) is right and left hand. If required the half Y fittings (G) can be replaced with full Y's, in which case the rack would probably be harder to upset, but it would occupy much more space then if built as shown.

GRINDING LOCOMOTIVE LINKS.

By A. E. Granville.

A GRINDER used in the Illinois Central Railroad shops, Vicksburg, Miss., for grinding locomotive links, is illustrated in Figs. 1 and 2. The link to be ground is held in the forks of two long swinging arms by means of set screws as shown. The arms are slotted so as to be adjusted for length, in order to obtain the proper radius. The pin on which these arms swing is carried in a block which slides in the pipe suspended from the ceiling. The block is run up or down by means of a screw inside of the pipe, and operated by a small handwheel on the lower end. This constitutes the feed, and is worked as the operator swings the link back and forth over the grinding wheel. As the wheel and spindle are slender, a support is provided at the outer end. This is more clearly indicated in the second cut.

NEGLECTED SAFETY PRECAUTIONS.

A TIMELY article in the "G. W. R. Magazine" calls attention to some obvious safety precautions, which, however, are too often neglected by machinists and others. Says the writer:

"You can't afford to be careless with moving machinery. Some men have a knack of trifling with lathes and machines for drilling, planing, shaping, and the like. They scrape the chippings away with their hands. They're given a little brush for the job, but it is too much trouble to use it. Injuries to fingers are quite frequent through this. The "safety" plan pays. It takes less time to pick up a brush than to get rid of a damaged finger." "Safety first," is a promising resolution for the new year.

FIG. 1—GRINDING LOCOMOTIVE LINKS.

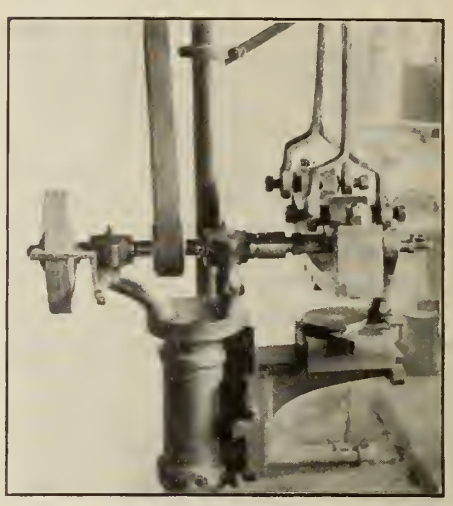


FIG. 2. CLOSER VIEW OF GRINDER.

COMMERCIAL SITUATION REVIEW.

SIR GEORGE PAISH, reviewing the financial and commercial situation in the Statist this week, predicts a long period of cheap money—unforeseen happenings apart—which will become more abundant and cheaper as the year advances. He recognizes that trade is falling, but says that the decline is less in Great Britain than in European countries, which are suffering from the influence of the Balkan war.

Sir George thinks that there are grounds for hoping that British manufacturers will be well employed for some time to come. France, he says, will benefit from the loans which she is about to issue, and which are likely to bring her numerous new orders. As a result she will suffer less than other countries from declining trade. The same may be said to a certain extent of Germany.

Recovery in the U. S.

"In the United States," says Sir George, "we expect a recovery rather than a decline, for the reduction of the tariff and the new Banking and Currency Act are calculated to benefit trade when the few difficulties of the reduction of the tariff are overcome. American manufacturers will be able to compete with foreigners much better than formerly, while the new banking law ought to give a great stimulus to foreign trade in every direction. We anticipate therefore comparative steadiness of trade in the United States, assuming that the crops will be good."

Series of Practical Questions and Answers for Engineers

Every care is being taken to include only pertinent practical questions, and give same, direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division of decimals, will be found a most useful companion study, and should not be overlooked.

Question.—To what strain is the shell of a steam boiler subject?

Answer.—To a tensile or tearing apart strain in the girth direction of the plate. For this reason we use the ultimate tensile strength of the material, in calculating the working pressure permissible.

* * *

Question.—If you were specifying the steel for boiler shell plates, what qualification would you make in respect to thickness and quality?

Answer.—That each be uniform, providing equal wear and strength throughout.

* * *

Question.—Is the shell of a boiler equally strong longitudinally and circumferentially?

Answer.—No, it is twice as strong in the latter direction as it is in the former.

* * *

Question.—In a new, well-designed, well-constructed boiler, where is the shell weakest?

Answer.—Along the riveted joint, due to the rivet holes.

* * *

Question.—Why is a butt joint preferable to a lap joint in a steam boiler?

Answer.—Because it avoids offsetting the plate ends, keeps the shell in a true circle, and gives a stronger joint.

* * *

Question.—What is the objection to welding the longitudinal joints of a boiler shell?

Answer.—No guarantee can be had of the reliability of a weld. The pressure being internal and bursting, would tend to aggravate any imperfection, and open the weld, causing an explosion.

* * *

Question.—What is the difference between a tube and a pipe?

Answer.—A tube is indicative of surface, a pipe of area. Example—A 3-inch tube will measure 3-inch outside diamcter, while a 3-inch pipe will measure 3-inch inside diameter.

* * *

Question.—Are two 4-inch pipes equal in area to one 8-inch pipe?

Answer.—No. The 8-inch has an area double that of two 4-inch pipes. Doubling the diameter, therefore, increases the area fourfold.

* * *

Question.—A water tube boiler has 150 tubes 3¼ inches outside diameter by 15 feet long. What is the heating surface in the tubes.

Answer.—First calculate the circumference of a tube 3¼ inches outside diameter and divide the result by 12 in order to get the answer in feet. Multiply this result by 15 feet length, and we shall get the heating surface of one tube expressed in square feet. The total heating surface of the tubes will be 150 times this amount.

$$\text{Thus } \frac{3.1416\times3.25\times15\times150}{12} = 1914.41$$

* * *

Question.—In a certain machine the work that should be obtained theoretically is 800 foot-pounds in a given time. The amount actually obtained, however, is found to be only 576 foot-pounds. What is the efficiency of the machine?

Answer.—Divide the actual amount of work by the theoretical. Express the result as a decimal fraction. The quotient represents the efficiency of the machine. Thus $\frac{576}{800} = 72$, therefore, the efficiency of the machine is $\frac{72}{100}$, or 72 per cent.

* * *

Question.—A safety valve is 3 inches in diameter; the lever is 24 inches long and weighs 15 pounds, its centre of gravity being 13 inches from the fulcrum. The weight of the valve and valve stem is 12 pounds, and the centre line of the valve is 4 inches from the fulcrum. If a weight of 70 pounds is hung on the end of the lever, at what pressure per square inch will the valve commence to blow off?

Answer.—First calculate the area of the valve, thus .7854×3×3=7.068 sq. in. The forces holding the valve down on its seat are three in number:

(1)—The weight, 70 lbs., multiplied by its 24 inches distance from the fulcrum.

(2)—The weight of the lever, 15 lbs., multiplied by the 13 ins. distance of its centre of gravity from the fulcrum.

(3)—The weight of valve and stem, 12 lbs., multiplied by their distance, 4 ins., from the fulcrum.

The above three moments act downwards, and their sum must be equal to the upward moment due to the total pressure on the valve, multiplied by its distance, 4 ins., from the fulcrum.

Call the boiler pressure P pounds per square inch. Then

$$P\times7.068\times4=(70\times24)+(15\times13)+(12\times4)=P\times28.272=1680\times195\times48=1923$$

$$P=\frac{1923}{28.272}=68 \text{ pounds.}$$

* * *

Question.—What is understood by the term "ultimate strength" when referring to materials of construction?

Answer.—It is the load which applied under the most favorable conditions, gradually without shock, vibration and intermissions or repetitions of stress will cause rupture or some other form of destruction; also, without regard to the elastic limit, and without regard to the final load which would complete rupture after breaking down of the material had commenced. In contradistinction to this, it may be stated that the actual capacity of a material to resist rupture depends on the nature of the load, and only whether applied suddenly, in which case, assuming the substance to be perfectly elastic; the member would give way simply from the apparent load being thereby doubled, but also upon the number of repetitions and the amount of the variations of stress. The experiments of Wöhler show that the greater the variation in the stress, the less the capacity for resistance on continual repetitions. This is most markedly so when the alternate stresses are in opposite directions, as is the case when a member is subject to tension and then compression. This is the condition in the piston rod of an engine which gets steam or both sides of the piston. The rod of a single acting air pump may be cited as an example of alternation between stress in one direction and the passive state, the conditions here not being so secure, and consequently the capacity of resistance greater on the continual repetition of the load.

Replacing Gauge Glasses.—One of our subscribers in Guelph, Ont., has experienced trouble through gauge glasses breaking within a few hours of their replacement after removal and cleaning. He says no such trouble arises when putting in new glasses, and believes, therefore, that an explanation of the breakage on replacement is possible, which, if put to practical use would eliminate the latter. Will some of our readers give their experiences in this feature of boiler room engineering?

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

ADJUSTABLE PROTECTION HOOD FOR GRINDER.

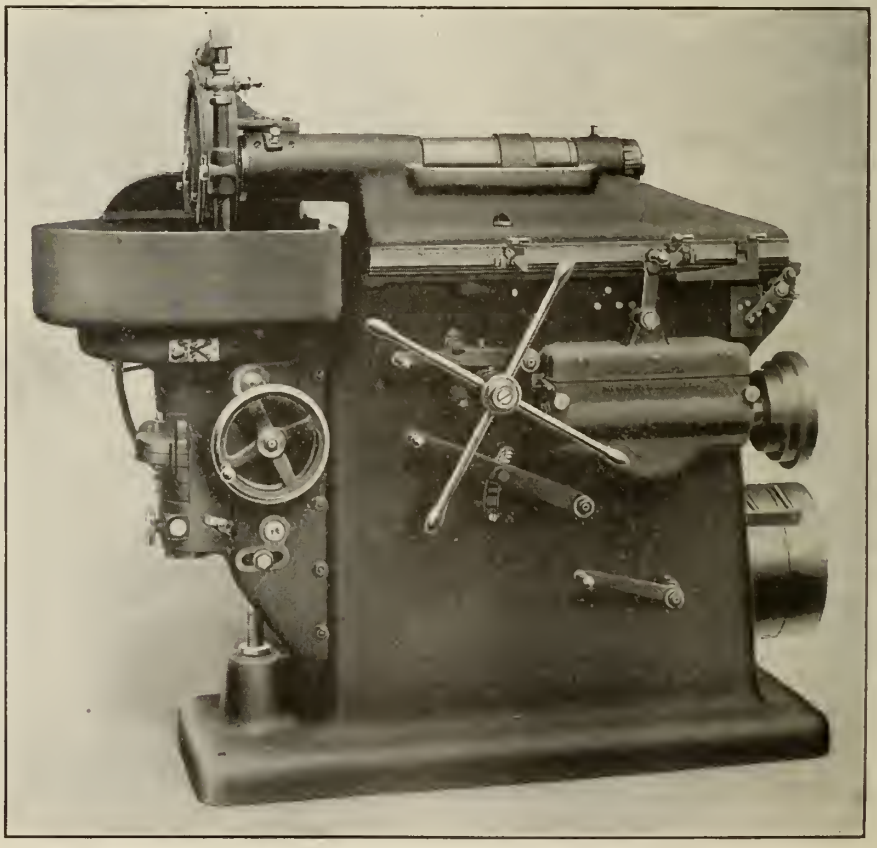
THE Valley City Machine Works, Grand Rapids, Mich., have added to their well-known line of grinders the adjustable protection hood here illustrated. The hood is applicable to any make of emery wheel stand, and affords protection to the smallest diameter wheels that it is practicable to use. It also protects the nut on the arbor.

ADJUSTABLE PROTECTION HOOD FOR GRINDER.

The photograph shows the 24 in. hood adjusted down to fit over an 18 in. diameter wheel. The latter, it will be noted, is fully protected, and the hood adjustment backward is such that the face of the wheel is get-at-able. The guards are made in all sizes from 8 in. to 24 in. diameter.

ROTARY SURFACE GRINDING MACHINE.

THE text and illustration refer to a new high duty surface grinding machine placed on the market by the Heald Machine Co., Worcester, Mass. It has been designed especially for the rapid and accurate finishing of flat surfaces on parts in great variety, such as can be rotated within a diameter of sixteen inches. Incorporated in its design are a number of excellent features that make it exceptionally convenient to handle, and insure a maximum output by eliminating the element of wasted time.



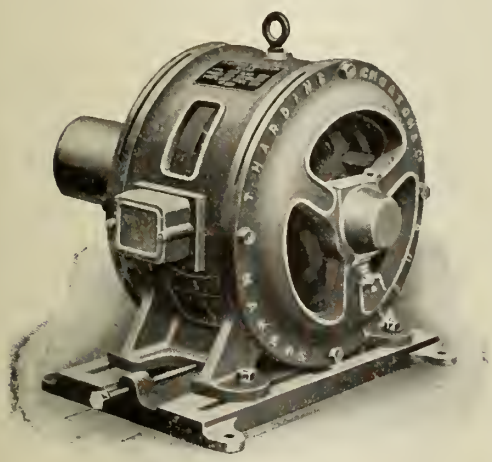
The machine is massive in construction, with the metal so distributed that the greatest rigidity is obtained, contributing to extremely accurate work, highly-finished surfaces and large production. No counter-shaft is required, as the machine is self-contained, receiving its power from a single belt direct to the main line shaft. All bearings have generous diameters, all shafts are carefully ground to accurate dimensions, and the ways, which are liberally supplied with oil, are provided with broad wearing surfaces that ensure the maintaining of proper alignment.

The grinding is done by the periphery of the wheel. Feed lines and radial scratches are eliminated by using the wheel in this way. The wheel spindle is large in diameter, hardened and ground, runs in adjustable phosphor bronze bearings provided with suitable means of lubrication, and with efficient adjustment for wear. The belt pull is downward, which, added to the weight of the wheel slide, prevents the wheel from lifting under heavy cuts.

A 12-in. or 16-in. magnetic chuck for holding the work is regularly furnished as standard equipment, but if the work to be ground can be held in chucks of other types, or by special fixtures, they can be substituted readily. Angular adjustment to the chuck or work spindle is provided for grinding concave or convex surfaces, a feature also valuable for correcting any disalignment that may take place. The work is fed to the wheel by elevating the chuck. This is accomplished by means of a screw and hand wheel having a graduated dial reading in thousandths of an inch. Automatic vertical feed to the chuck can be furnished when specified, and is a valuable feature when more than one machine is to be run by one operator.

The machine is regularly equipped with pump, tank, water guards and all connections for wet grinding. A generous supply of water under absolute control of the operator is delivered at the grinding point, and the guards are so designed as to thoroughly protect the operator, keep the water off the floor and out of the bearings.

Centralized control is a strong feature of this machine, every lever and wheel being within easy reach of the operator from the position he naturally assumes when handling the work. While the actual diameter that can be ground is 16 in., the machine will swing 22 in., thereby making it possible to handle parts that have projecting surfaces, or feet,

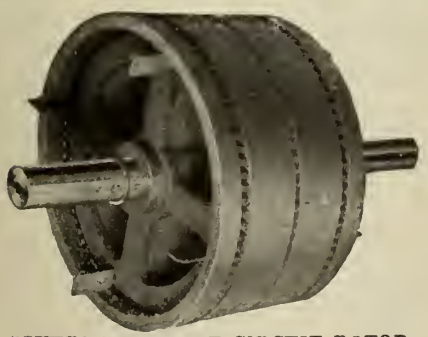


"HEALD" ROTARY SURFACE GRINDER.

beyond the actual diameter that can be ground. The thickness of work that can be handled is 4½ in. with full diameter of wheel; but work up to 7 in. can be handled by using a smaller wheel.

The floor space occupied is 4 ft. by 6 ft.; the power required 5 h.p., and the net weight 3,500 pounds.

THE "CHURTON" INDUCTION MOTOR.



THE accompanying illustrations show a high grade induction motor as manufactured by the T. Harding Churton Co., of Leeds, England, who are specialists in producing alternating cur-

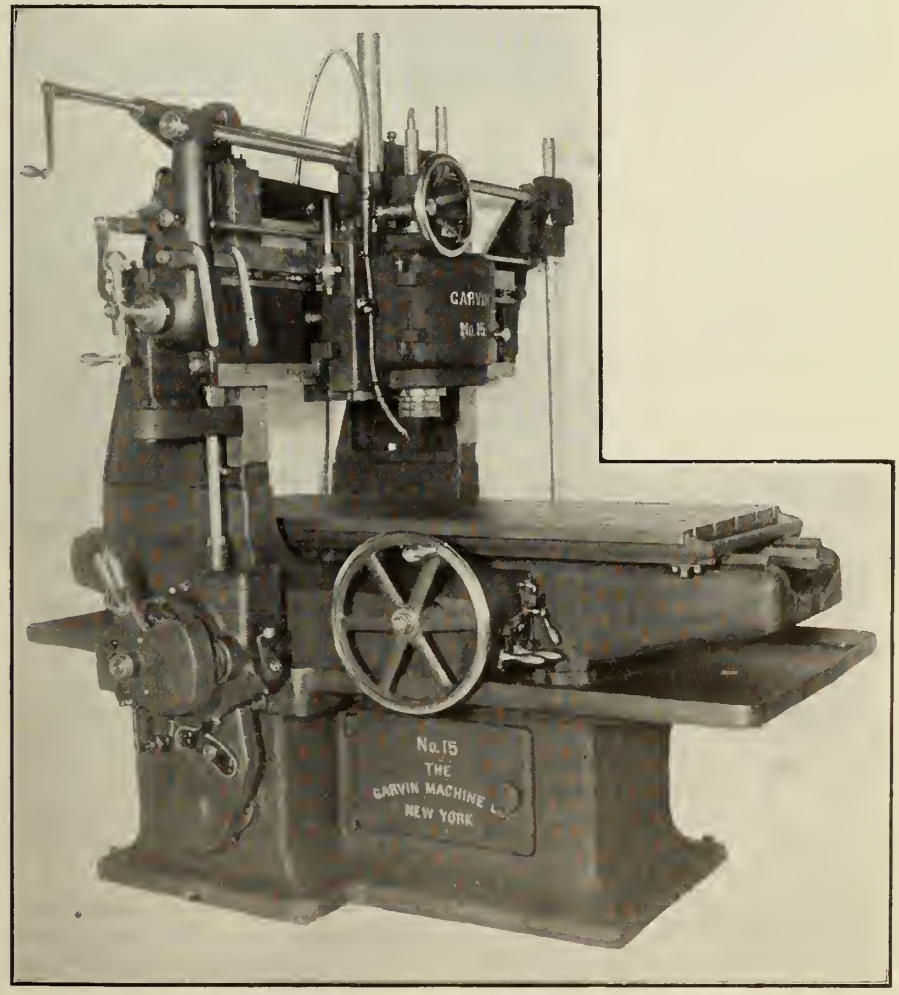
"CHURTON" MOTOR.

rent motors. By giving unremitting attention to this particular line, they claim to have reached as near the acme of perfection as possible.

Noteworthy among the details of construction of Churton motors may be mentioned the connecting rings of the short current rotor. The usual methods of connecting these rings to the rotor conductors by bolts and nuts, or by riveting, are not infrequently causes of trouble due to the effects of continual

"CHURTON" SHORT CIRCUIT ROTOR.

expansion and contraction, and the efficiency of a motor with the rotor so constructed may seriously depreciate after working for some time. Another method of connecting the conductors by wires interlaced around the ends and soldered together has the disadvantage that the solder is apt to be melted off by temporary heavy overloads that the motor should sustain without injury. To overcome these difficulties the Churton people introduced their "cast welded" system, in which the connecting rings are, by a special process, welded direct to the conductors, thus obviating joints of any kind. This method has proven entirely successful, the rotors so constructed being practically indestructible.

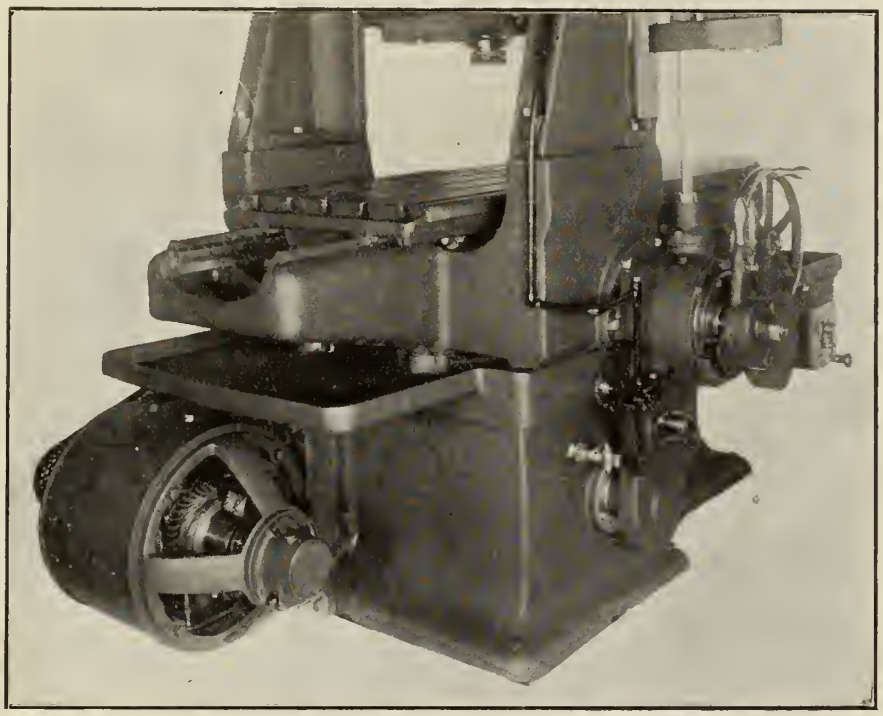


The Stuart Machinery Co., Ltd., of Winnipeg, Man., are the Western Agents for "Churton" motors, and carry a stock of sizes ranging from 1 to 50 h.p.

NO. 15 VERTICAL SPINDLE MILLING MACHINE.

THIS type machine, which has been developed to a high pitch of efficiency, by the Garvin Machine Co., New York, now offers a number of special features not formerly available. Both table and cross slide are provided with accelerated feed in either direction, controlled by automatic trips in the same manner as the regular feeds, thus saving time and conserving the energy of the operator. The drive is self-contained, being by cone pulley carried by bracket on the base of machine, and connected by splined shafts to the spindle. This greatly facilitates the application of motor drive, which can now be attached by silent chain to the cone pulley shaft as shown.

The power is applied through bevel and spur gears to the prolongation of the upper ends of the spindle and back shaft. By the shifting of one gear, the spindle may be driven direct at high speed, or through the back gearing at slow speeds, and in each case the direction of rotation is the same. The spindle has a threaded nose, ¾ in. diameter, 3½ pitch, left-hand, to take a B. & S. No. 24 cutter, and having power sufficient for a 12 in diameter, of cutter.



The table movement is by Seller's motion of oblique worm, ball thrusted, and controlled by pilot wheel. Both table and cross slide are fitted with double feed boxes, giving the regular and a very fast feed at will. Each kind of feed is thrown in by separate handle, and controlled by dogs on the table and cross rail in the ordinary way. Two kinds of dogs are provided on both table and cross slide. One set of dogs permit of tripping in either direction and coming up against a solid stop, and the others are buttons which trip, but permit of passing over. On the cross slide rail the same handle thrown in trips the feed. The fast and regular feeds are in the same rotation, so that the arrange-

"GARVIN" VERTICAL SPINDLE MILLING MACHINE.

ment permits of quick jumps over intervening spaces between cuts.

An interlocking arrangement prevents both kinds of feed being thrown in at the same time. One turn of the change feed handle throws the change box neutral, or out of action, and, when this is done, a special lever on the change box can be operated to traverse the table or cross slide rapidly back or forth by

"GARVIN" VERTICAL SPINDLE MILLING MACHINE.

power. This special lever is interlocked with the change box to prevent accident.

An enumeration of the features of the machine includes the following:—Changes of back gears; vertical adjustment of spindle slide, with micrometer stops and binder handles; change feed box, with reverse of feed; convenient control of all movements; guarding and oiling of all gears; oil pump facilities.

CAN. CEMENT CO. CLOSING ONTARIO PLANTS.

THE following official statement was handed out this morning from the office of the Canada Cement Co.:

"Owing to dullness of business, we have decided to close down for the balance of the year 1914 or until further advised, plants No. 6, Marlbank, Ont.; No. 7, Lakefield, Ont.; No. 9, Shallow Lake, Ont.; and No. 10, Calgary, Alberta. W. H. Ford, general sales manager of the Company, stated that the discouraging prospects and the present stagnation in the building trade made this step imperative. Several cement companies have already gone under the the present stress, said Mr. Ford, and it was impossible for Canada Cement Co. longer to keep in operation mills which were running at a loss. No further shipments of empty bags will be taken at the Ontario mills after February 1.

FIRST STEAM VESSEL THROUGH PANAMA CANAL.

HE first passage of a self-propelling vessel through the Panama Canal from ocean to ocean was effected on the morning of Wednesday, January 7, when the crane boat Alex. LaValley, Captain Carter, formerly engaged in the Atlantic entrance, but recently operating in Culebra Cut, was passed from the Cut through Pedro Miguel and Miraflores locks to the Pacific entrance. Barges from the Pacific side, passed about in the dredging operations, had previously been handled to the Atlantic side. The La Valley left Pedro Miguel Lock at 9.30 a.m., reaching Miraflores locks at 10.15, and was passed into the Pacific channel at 11.05 a.m. No passengers were carried, only the regular crew being allowed on the vessel.

The La Valley is a unit of the old French floating equipment, and was built by Lobnitz & Company of Renfrew, Scotland, in 1887, afterwards being rebuilt at the Cristobal dry dock shops in 1905. She is an iron hull, twin screw vessel, with a length of 186 feet, beam 41 feet, and depth of 15 feet, equipped with forward and amidship cranes, the forward crane having a lift of five tons, and the amidship crane a lift of 56 tons. The propelling engines were built by Lobnitz & Company and are compound, the cylinders being 16 and 30 inches diameter by 24-inch stroke. The boiler is of the Scotch type, American make, length 12 ft. and diameter 12 feet.

OFFICIAL TRADE FIGURES.

THE following are the official figures of the trade between Great Britain and Canada, in the undermentioned articles, during December, 1913:—

From Canada—	Dec., 1913.	Dec., 1912.
Wheat	£911,469	£760,726
Wheat, meal and flour	196,171	196,122
Oats	34,525	20,749
Cattle	....	....
Bacon	52,031	69,929
Hams	23,083	19,501
Cheese	236,875	262,099
Canned salmon	149,731	66,808
To Canada—		
Spirits	52,970	46.136
Sugar	578	5
Wool	14,348	11,720
Pig iron	2,085	3,495
Railway iron	1,403	1,215
Galvanized sheets	8,564	21,873
Tinned plates	6,244	11,298
Steel bars, etc.	11,698	14,333
Pig lead	4.580	4.191
Unwrought tin	12,067	19,052
Cutlery	5,247	9,320
Hardware	6,030	7,467

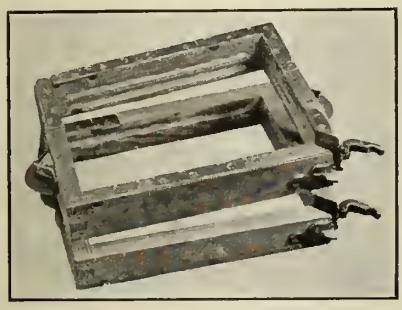
The following table gives figures for the twelve months ended December 31, 1913:—

From Canada—	1913.	1912.
Wheat	£8,803,949	£8,844,953
Wheat, meal and flour	2,261,783	2,216,077
Oats	750,693	703,982
Cattle	36,212	142,508
Bacon	863,139	1,175,527
Hams	336,695	231,379
Cheese	4,038,627	4,347,832
Canned salmon	900,068	723,698
To Canada—		
Spirits	730,142	727,596
Sugar	40,803	122,192
Wool	119,434	128,316
Pig iron	189,442	265,957
Railway iron	6,329	17,535
Galvanized sheets	470,324	368,508
Tinned plates	155,444	123,266
Steel bars, etc.	341,066	195,886
Pig lead	141,644	213,354
Unwrought tin	175,549	196,638
Cutlery	106,706	119,880
Hardware	111,836	117,165

ACCIDENTS ON RAILWAYS.

THE Dominion Railway Commission report for the fiscal year ending March 31 last, states that 643 persons were killed on the railways, of whom 250 were trespassers, 21 passengers—of whom 15 met death in trying to leave or board trains while in motion—and 303 were employees. The injured numbered 2,231, of whom 410 were passengers, 75 being hurt from preventible causes.

During the year 200 fires were reported as having started within 300 feet of railway tracks, and 164 were credited to trains. A total of 25,148 acres were burned over, entailing a loss of $88,480.



FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

THE "GUELPH" RIGID SNAP FLASK.

THE importance of a good, durable and rigid snap flask is fully realized by foundrymen, and the accompanying particulars concerning a snap flask designed and manufactured by the Guelph Pattern Works, Guelph, Ont., to secure these qualities are likely to prove of interest.

The ends are dovetailed, glued and nailed in two directions, while the corners are further strengthened by means of malleable iron corner brackets, extending 5½ inches on each side, screwed on, and having lips on the under side which grip the flask firmly. The hinges are

"GUELPH" RIGID SNAP FLASK.

simple and are fitted with a large wearing pin. A special hook catch is used, the feature of same being its instantaneous and positive action.

The top and bottom edges are fitted with malleable iron strips secured with screws every 2½ inches, and the trimmings generally are of high grade malleable iron. The lumber used in the manufacture of the "Guelph" rigid snap flasks is selected kiln-dried Georgia pine, 1¼ inches thick, although oak or maple is supplied when required.

BUILDING AND EQUIPMENT OF A MODERN PATTERN SHOP.

By Thomas Roberts.

IN most works where the staff of pattern makers is not large, it has been the practice to place these workers in any out of the way corner, or in some part of a gallery in the machine shop, but the insurance companies are now insisting on having them placed in a separate building, which in the writer's opinion is the proper thing to do. If possible they ought to be on the ground floor, so that the quick-running machines which they use will have no great amount of vibration.

The building should have side lights, as well as top lights, although the top lights need not be more than one-sixth of the roof. The height of the shop should be not less than 12 ft. at the sides, and if the comfort of those who have to work in it is considered, the floor ought to be of wood, not concrete or flags. It is here that the insurance company steps in. To them the comfort of the workshop does not matter; they have their own interests to look after.

Another matter is the ventilation of the workshop. If this is not given the importance it deserves we find that towards the end of the day the workers show pronounced signs of fag, and draughty windows and doors are thrown open with disastrous consequences to health. Again, where there is much sawdust, and a large number of machines throwing off dust, there ought to be a fan provided at one end of the room, and pipes to take away the dust.

The best ventilated and cleanest pattern shop the writer has worked in was fitted with a cyclone dust-collector fixed outside the building, with pipes attached to each machine to draw off the sawdust and cuttings. There were also pipes for the sweepers to brush the shop rubbish to, and the collector took away all sawdust, shavings, and waste, leaving the screws, sprigs, nails, and lost tools, which were brushed to the sump hole, to be picked up by the sweepers. The dust collector also acted as a good ventilator.

Equipment.

Coming now to the question of equipment, and in giving an opinion on this subject we take as our standpoint pattern shops with over 12 journeymen employed. The machines required to prevent time being lost by men being kept waiting are as follows:—

One circular saw to 15 men.

One band saw to 15 men.

One planing or thicknessing machine to 20 men.

One small hand trimmer to six men.

One large hand trimmer to 20 men.

One Wadkin pattern making machine where there is plenty of work for it.

One face-plate lathe where the pattern-making machine is installed.

One face-plate to 10 men where there is no pattern-making machine.

One hand planing machine.

One lathe on bed to six men.

One wet grindstone, one dimension saw.

One sand-papering machine where a dust collector is handy.

One medium-size drilling machine.

One small pillar drill with sockets to take brace drills.

One cast iron planed setting-out table with angle lines marked on, size about four feet square.

Two double glue pots.

Pattern-makers' Stores.

The pattern room stores for materials used in the workroom is a necessity, and if possible might be located near the centre of the room, care being taken that it is not an obstruction, and that it is handy for the workers. The storekeeper can fill in his spare time by making out time cards, and performing other small duties which would help the foreman in his clerical work.

Another convenience is a drawing stores, where the plans which are standard and kept for pattern shop use are placed in bundles of 50 for easy reference. This stores need not be a large one, but it prevents a waste of time. The cost is not great, and it is very cheaply made. A corner of the room should be reserved for pattern painters, and this should be where there is not much dust.

A complete set of work-tables for all workers in the room ought to be provided. There are also required band saw blade setting, sharpening and piercing machines. The man in charge of the tools will require to keep in stock extra knife blades for trimmers, planing machines, and extra pulleys for band saws, so that the machines are not stopped for any great length of time for repairs.

In a recently built pattern shop, the workers are placed on each side of the room where there is no glass in the roof; the middle part under the glass roof being clear for the making and altering of large patterns. The tools are arranged down one side of the centre part, so that they can all be worked from one line shaft, which is driven by a motor placed at one end of the room. All the benches are single benches, and can be moved about when a large space is required in any part of the room. The size of the room is 170 ft. long and 72 ft. wide and 12 ft. high at sides.—From a paper read before the Manchester Association of Engineers.

INDUSTRIAL NOTABILITIES--No. 19

"I BELIEVE that the psychological influence of enthusiasm is incalculable; and while I can scarcely claim to be the possessor of any extraordinary ability, yet perhaps enthusiasm has been the principal factor in my success." This is the admission of William McMaster, one of Montreal's most successful business men. He recently came prominently before the public by being appointed to the directorate of the Bank of Montreal.

His enthusiasm, however, brought him success in another field long before he became interested in banking. It made him an engineer, and the head of one of the largest steel plants in the Canadian Metropolis. When a boy, his parents were not able to give him a university education, but they gave him Scottish blood and those other qualities necessary to a man who is to make a success.

He was born in Montreal, and got his education at the old Collegiate School in that city. Still keeping up his studies, he entered the offices of Moreland, Watson & Co., where this quality—enthusiasm—got him transferred to the Montreal Rolling Mills, which this company controlled, and it was enthusiasm and hard work that made him successively sales-manager, secretary-treasurer, superintendent, and finally vice-president and general manager. When the rolling mills became incorporated in the Steel Company of Canada, he retired, and his son, R. H. McMaster, is now the manager. The Montreal Rolling Mills had, however, become under the management of William McMaster, one of the most important steel plants in Canada.

WILLIAM McMASTER.

He has been a power in various trade organizations. The Metal and Hardware Association elected him as president in 1891. He served upon the council of the Montreal Board of Trade in 1898 and 1899. In 1903 he became president of the Montreal branch of the Canadian Manufacturers' Association, and he was one of the influential body of delegates chosen to voice the views of the Dominion at the Commercial Congress of the Empire in London, England.

The widespread character of his influence is shown by the numerous companies of which he is a director. These include some thirteen of the larger commercial, manufacturing and financial concerns of Canada. One industry in particular he has done much to develop; viz.: the manufacture of explosives. He is also a director of the Dominion Iron and Steel Co.

He believes that it pays a young man to stick to one line of endeavor. The tendency to-day, he says, is for young men to throw up a fairly good position for one new and untried that offers for the moment a better salary. He is fond of sports, especially golf and yachting, and pastimes in which he himself can take part.

THE COMING OF A GREAT INDUSTRY.

WHETHER our sentiments, convictions or politics be in line or otherwise, there is gradually being ushered in an era of Canadian history, in which shipbuilding and marine engineering—mercantile and naval, with their attendant and accessory industries, will contest and possibly usurp in importance those manufactures which at present occupy premier place in our national economy.

Evidence is available on every hand that an insistent and well-defined policy is being pursued by several powerful "Old Country" corporations interested in various departments of marine engineering and ship-building, towards the creation on our shores of enterprises of that nature, and while in some quarters little heed is being paid to such happenings as the prosecution towards completion of the plants of the Canadian Vickers', Ltd., and the Armstrong, Whitworth of Canada, Ltd., and to the purchase by Yarrow's, of Glasgow, of marine interests on the Pacific Coast, these are no less real and definite stages in the ship-buildingization of this Canada of ours .

A few months ago, we published not only a descriptive and comprehensive article covering the Vickers' plant at Montreal, but in addition gave official information concerning the near future date of its completion, including equipment for service. The plant of Armstrong, Whitworth of Canada, Ltd., which was described more or less briefly in our Annual Review Number, of date December 25, 1913, is meantime, of course, reputedly more or less of a tool steel proposition, but who believes that the Canadian market is so attractive for the disposal of that product as to warrant such a heavyweight corporation settling on our shores. The advent of Yarrow & Co., on the Pacific Coast is another step in the ladder, and the merging of our lake and river steamship companies into one gigantic combine, known as the Canada Steamship Lines, Ltd., makes provision for catering to the ship-building corporations as the enterprise develops. Irrespective of our views on a "Laurier Navy," or a "Borden Emergency," there is being scientifically and systematically developed a policy which will put Canada in a place of honor relative to the industries of ship-building and marine engineering, and when economic conditions are considered, who is there that can reasonably find fault?

The world's ship-building and marine engineering returns for 1913 are now public property, and, as anticipated, constitute a record. As was to be expected, Great Britain again takes premier position in tonnage launched, and engine horse-power installed. It is, however, worthy of note that other countries have shown considerable development and progress, both in the number and size of the vessels launched. We in Canada still occupy a somewhat obscure place in the record, and were it not for the preparations now being made, there would be little hope of our getting much higher up. Strenuous efforts are being put forth in the United States to raise the production standard of its ship-building and marine engineering, although little success is as yet apparent, and emulating as we do our American brethren in so many other directions, we might do worse than follow their example in propagating these twin industries in our own land.

Over-much is made of the cost of labor in Canada when compared with Great Britain, for after all, the difference against us is of little moment. During the year just gone, labor troubles in the matter of "strikes" did some material hurt, but these were really insignificant when the matter of "broken time" falls to be taken into account. In the shipyards and engineering works of the "Old Country," particularly the former, the "broken time" feature amounts to a positive curse, and had it not been for the unprecedented extent to which it attained during 1913, the output record would have been increased by many thousand tons.

Many men work from two to four days a week only, yet earn in most cases sufficient for the purpose of a livelihood to themselves and those dependent. If these men stuck to their work as, we are glad to say, our Canadian operatives do, then the wage preponderance in favor of Canada would entirely disappear, and the bugbear of high production cost with it. This feature is not being lost sight of in the planning of ship-building plants on our shores, and with the materials of construction costing little more, there is no drawback to the forward progress of the Canadian ship-building industry.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Jan. 26, 1914.—The machinery trade continues to show an improved tone, and conditions are considerably better than they were a month ago. However, business is not yet by any means as good as dealers would like to see it, and orders actually booked during the last few weeks have all been small.

The demand for steel bars and pig iron, also for plates, is quite brisk just now, and good orders are being received. These, however, are all for present requirements, it being too early yet to look for spring enquiries. Business in old metals, on the contrary, remains very quiet, and prices quoted are merely nominal.

The Canadian Society of Civil Engineers will hold their twenty-eighth annual meeting here January 27 to 29. The first day will be occupied by business sessions and an address by the retiring president (Mr. Phelps Johnson, of the Dominion Bridge Co.). In the evening a smoking concert will be held. On January 28 a visit will be paid to the works of the St. Lawrence Bridge Company at Rockfield, where the progress of the various members of the Quebec Bridge will be inspected. In the evening the annual dinner of the society will be held at the Engineers' Club. On the final day the announcement of the results of the election of officers and members of council for 1914 will be made, and the final business session will be held.

On Saturday last, Montreal's annual automobile show was opened at the Craig Street Drill Hall, and will last a fortnight. The present week is devoted to pleasure cars, while next week a large number of representative motor trucks will be on view.

A press despatch to-day from Sydney, N.S., states that the plant of the Dominion Iron and Steel Co. reopened this morning after being closed down two weeks for repairs. It is said that there are sufficient orders on hand to keep the plant busy until well into the summer. Orders received for rails some time ago from the C. P. R. and I. C. R. are being rushed, and, as soon as these are finished, a commencement will be made on the order for rails lately received from the Australian Government.

Toronto, Ont., Jan. 27, 1914.—The Toronto "Globe" greeted this city yesterday morning with a big headline on its front page announcing that:—"Steel, The Barometer, Shows A Rising Sun." A cable from the Globe's special correspondent in Pittsburgh stated that steel orders were coming in rapidly, and that in ninety days, the mills would be running to capacity again. The market here was unmistakably more cheerful, and no manufacturer need now hope to make contracts ahead at the old price—$1.20 f.o.b., Pittsburgh. Some of the larger sources of supply this week have been asking an advance of a dollar a ton covering second quarter deliveries. This means that for the first three months manufacturers expect to be fairly slack, but they are sure that after March, things will be better. They are not going to do as some steel makers did two years ago when conditions were dull. In that year, several concerns booked orders ahead at their low rate and were selling steel bars at $1.10 when others were getting $1.40.

It is very pleasing to learn that orders for steel placed in the city during the past few days have exceeded by far the amount placed for many a day.

A certain Canadian steel company that buys its billets and skelp from the United States Steel Corporation was informed this week that the price of the latter's product was about to go up, and were given twenty-four hours in which to get in and buy. The inducement was effective. The Canadian company placed a very big order.

A prominent Toronto agent believes that the mills will be working full again by July. People have been hesitating, he says, with the hope that steel might get cheaper, and have decided that it won't; so they are buying. The market is strengthening as a result, and is changing from a buyers' to a sellers' market. While local manufacturers generally are buying, it is the structural men who have effected the change in conditions. More new propositions are being talked about than for some years, and people are preparing to spend money.

Pig Iron.

Another very promising sign is that foundries are taking an increased amount of pig iron, and that the market is strengthening. The two largest makers of pig in Ontario are reported to be doing considerable business.

Machine Tools.

The feeling in the machine tool market is distinctly better, though no big sales of tools are reported. The Detroit office of the Michigan Central Railway advises that the recommendation of the mechanical department re machine tools required for the St. Thomas shops, have not been received. The H. Mueller Mfg. Co. have purchased two large Hendey lathes this week for their Sarnia plant. The Electrical Steel & Metals Co., Welland, who have been in the market for machine tools, have bought a considerable quantity, mostly second-hand, and a crane from the Toledo Crane Co. The Galt Knife Co., Galt, Ont., recently organized by Thos. Vair, bought a lathe and punch last week. The Dominion Power & Transmission Co., Hamilton, are considering the purchase of an electric crane for their new power house.

Metals.

Tin rose a half a cent a pound. Copper rose only slightly. There have been a few more inquiries, which show that the market is stirring. There have been no sales of scrap iron.

James A. Coulter, president and general manager of the John Morrow Screw and Nut Co., Ingersoll, Ont., was a candidate for municipal honors at the recent election in Ingersoll. He received the largest vote of any councillor. In 1907-8 he was Mayor of the town.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Bradford, Ont.—A carload of machinery has arrived from Toronto for the Watson, Limited, new plant.

Hamilton, Ont.—The Tallman Brass Co. propose to make additions to their factory at a cost of about $15,000.

Victoria, B.C.—It is reported that the Canadian Steel Studding and Mfg. Co. will erect a new factory estimated to cost $25,000.

Midland, Ont.—The machine shop of Jas. Wilkinson on the dock took fire on Sunday, January 18, destroying the frame and roof.

Elk Lake, Ont.—Twelve team loads of machinery for the Mapes-Johnston Mine left Elk Lake on Friday en route from the Montreal-James Mine.

Edmonton, Alta.—Gorman, Clancy & Grindley, manufacturers of builders' supplies, will buy engine, boiler, pumps, etc., to present to the Technical School.

Calgary, Alta.—It is reported that the Merryweather Co., London, England, will erect a factory here, to manufacture fire apparatus. The factory will cost $250,000.

Bridgeburg, Ont.—Tuttle & Bailey Mfg. Co., New York, makers of registers, ventilators, etc., who proposed to erect a plant here, advise that their plans are still indefinite.

Edmonton, Alta.—The Edmonton Iron Works, Ltd., machinists, iron and brass founders, etc., state that they are making alterations to their plant, but will not be buying machinery.

Vancouver, B.C.—The Tillsonburg Electric Car Co., Tillsonburg, Ont., are reported to be contemplating the erection of a branch plant in the West, if offered a site, power, and exemption from taxation.

Morrisburg, Ont.—The Morrisburg & Ottawa Electric Railway Co. are trying to get possession of an unused sheet-steel mill at Morrisburg for the manufacture of steel of different kinds, and for the construction of electric cars.

Hamilton, Ont.— The Schacht Motor Car Co. will discontinue business here. F. L. Reid, manager, states that someone else will probably handle the repair department, and that the factory will not remain idle.

Edmonton, Alta.— Equipment for instructing electrical workers and prospectors is being purchased. With the exception of four engine lathes and one shaper all the equipment for the machine shops has arrived.

Fort William, Ont.—A committee of the Board of Trade, consisting of J. P. Jones, S. C. Young, J. T. Horne, W. A. Dowler and the president will endeavor to secure Government assistance towards the building of an ore dock at this point.

St. Mary's Ont.—The new addition to the Richardson foundry is now completed. It is a substantial stone structure, 2½ storeys high. The Company do a large business in dairy utensils. A considerable quantity of new machinery will shortly be installed.

Vancouver, B.C.—Wilson & Perry, assignees, 336 Hastings St., W., are calling tenders for the stock and machinery, consisting of lathes, drills, shafting, belting, electric motors, etc., of the Gourlay Machine Works, 1112 Albert Street, Vancouver.

Port Arthur, Ont.—The Conley Frog & Switch Co., the parent plant of which is in Memphis, Tennessee, will start building their Canadian branch plant here in the spring. Mr. Conley will be here shortly to make all arrangements. They will manufacture railway supplies.

Port Arthur, Ont. — An iron claim, eight miles from Rosmere Station on the C.N.R., was sold last Saturday for $100,000. The claim was sold by Colonel Little, of Port Arthur, to a syndicate said to be composed of outside capitalists. A drill is to be put on the property at once and the extent of the deposit ascertained. Judging from samples already analyzed, it is very rich.

Exeter, Ont.—The Exeter Manufacturing Co. have been securing machinery and supplies for the plant recently acquired by them, and have started operations. This firm was recently incorporated with a capital of $20,000 to take over the business previously conducted by James Murray & Son, Exeter. They will make bells, roadmaking tools and machinery, cast iron pipes, pumps and other specialties.

Hamilton, Ont.—The Willys-Overland of Canada, Ltd., will take over the factory of the Schacht Motor Car Co., and, after making necessary extensions and changes to accommodate their requirements, will start the manufacture of cars. J. N. Willys, the president, is also president of the Willys-Overland Co. of Toledo, Ohio. The capital of the new company is $500,000. The directorate and staff will be announced shortly.

Winnipeg, Man.—L'Air Liquide Society, Paris, France, with plants at Montreal and Toronto, will commence the erection of a plant costing $60,000 this spring, at 325 William Ave., Winnipeg. P. E. Wicke, Montreal, has charge of the work. In this plant they will manufacture oxygen, nitrogen, and liquid air. The equipment will be similar to that at Toronto, which consists of purifying apparatus, air compressors, electric motors, and a machine shop. They will also carry a complete line of oxy-acetylene welding and cutting outfits.

Welland, Ont. — Contractors on the new Welland Canal have purchased a considerable quantity of machinery. Baldry, Yerburgh, & Hutchinson, St. Catharines, contractors for Section 2, have bought some machinery used on the Panama Canal. The Dominion Dredging Co. on Section 1 have started excavating and dredging with 200 men, while two steam shovels will start on Section 2 next week with 50 men. O'Brien & Doughney, on Section 3 have 500 men, and are cutting down a hill. The Canadian Construction Co. on Section No. 4 will not begin work until spring. Yale & Reagan, St. Louis, Mo., who have a sub-contract on No. 2, moved their plant up last week.

Electrical

Lambeth, Ont. — An agitation for Hydro-Electric power is to be begun.

Waubaushene, Ont.—Steps are being taken towards securing electric light for the village.

Wyoming, Ont.—The Town Council requires a new dynamo and additional electric lighting equipment. H. G. Taylor, clerk.

Prince Rupert, B.C.—The hydro-electric agreement, involving the giving of franchises to a private corporation, was beaten at last week's election.

Welland, Ont. — The Welland Electrical Co., are making extensions in Crowland and Pelham, while an extension into Humberstone is contemplated.

Why The Advertiser Succeeds.

¶ Why is it that during the last few months, when money was admittedly tight, the manufacturers who advertised the most felt the pinch the least?

¶ And how is it that now, when the circulation of money is less restricted, the manufacturers who felt the pinch the most will be the last to experience relaxation and relief?

¶ The same wisdom and foresight which prompts a manufacturer to advertise will naturally guide him in forming his whole selling and general business policy, and, like a good general, he is prepared for every contingency and emergency.

¶ The fact that the successful business men is an advertiser is usually incidental. He is an advertiser because he is wise and possessed of good sound business sense and an analytical mind. At some time or other he came to the conclusion that advertising could be made one of the mightiest factors of his business organization, and having arrived at this conclusion, he just naturally went to it and advertised.

¶ He had faith in his product, and his own faith manifested in a public way, inspired confidence in the minds of his prospective customers. His name and his manufactured product became synonymous with good service and satisfying quality. The public became acquainted with the merits of his line and familiar with its outstanding features.

¶ Consequently, when conditions were normal, he secured a liberal share of business and received first consideration when purchases were made.

¶ When money tightened and business was curtailed, he continued to get the lion's share of what was going. When purchases were carefully considered the advertised line received first attention and usually secured the order.

¶ And now that the financial tide is coming back, the advertiser is getting the biggest slice of the business melon, simply because during those cloudy days of curtailment, his advertising message had been studied and absorbed at a time when the public mind was most receptive.

¶ It pays to advertise if your line is good, and it pays to buy advertised lines, because they are invariably satisfactory. The general public have long been educated to believe that advertised goods are best. Can't you see that you are laboring, not only under a handicap, but under a cloud, if your product is not advertised? Publicity dispels the cloud of suspicion and removes the handicap.

¶ You'd better hop on to the band wagon right away. Hopping on now, when the prospects for big business are so bright, will be not only timely, but extremely profitable.

Hamilton, Ont.—The prospects of the Hydro department adopting the new German nitrogen-filled Tungsten lamp for the 360 standards to be erected in the underground district are good.

Yorkton, Sask.—Debentures sold include $18,000 for waterworks, $45,000 for the outflow sewer, and $34,678 for electric light. An offer for a $65,000 electric light issue has been received.

Stouffville, Ont.—The village intends immediately to take over the local electric plant. The council have already purchased material to improve the plant from the Hydro Commission, amounting to about $500.

Toronto, Ont.—The Methodist Book & Publishing Co. will have six elevators in their new building and provision for the installation of another. They will also instal a power plant of their own in the basement.

Embro, Ont.—With the receipt of satisfactory estimates from the Ontario Hydro-Electric Commission, a by-law providing for the installation of the service here will be sent to the ratepayers as soon as possible.

London, Ont.—The complete equipment for furnishing the street railway system with hydro power will be installed in the course of the next few weeks, and by Feb. 25, it is expected that the system will be operated entirely by hydro.

Moose Jaw, Sask.—Provision is being made for the erection of a power house by the Government for the supply of power for the new elevators at Moose Jaw. It is understood that the Government will also install a gas producer plant for generating its own power.

Welland, Ont.—At a meeting of the local Hydro-Electric Commission last Friday, the installation of electric pumps in the waterworks' pumping station and furnishing current were discussed. Electrically- driven pumps will be necessary when the river level is raised.

Cobden, Ont.—Reeve Connelly, Councillors Dr. J. R. Stewart and H. Camby have been appointed a committee to report upon the probability of obtaining a suitable water power for the purpose of generating sufficient electric power for street and house lighting and general use of the village.

Fort William, Ont.—R. S. Kelsch, consulting engineer, Montreal, says tentative arrangements have been made for new work on the Kaministiquia power plant here, costing about $500,000. The extensions will include a 14,000 horsepower turbine generator, and a concrete flume, 10 feet 6 inches in diameter. These additions to the plant are necessary to care for the rapidly increasing load at Fort William.

Victoria, B.C. — The Stamp Falls Power Co. was recently incorporated in British Columbia. The capital is $150,000. Among the objects are, to acquire the rights of the Ritchie Agnew Power Co. in the Alberni district, and an option to purchase all the interests of the British Columbia Hydraulic Power Co. and water rights on Nanaimo River and the Company's forty-year franchise for electric light, power and heat in the city of Nanaimo and other interests of the Company in water rights on Stamp River.

EQUIPMENT REQUIREMENTS

The Canadian Buffalo Forge Co., Montreal, who have about completed a plant in Berlin, Ont., for the manufacture of blowers, exhausters, etc., are in the market for the following equipment, further particulars regarding which may be secured from Allan G. McAvity, managing director, Montreal:—

2 7½-ton electric cranes.
1 Keyseater, 1½-in. capacity.
1 48 in. x 36 in. x 8 ft. planer, with side heads.
1 12-in. universal milling machine.
1 20-in. geared head turret lathe.
1 1-in. to 2-in. pipe machine.
1 Tapping machine, heavy duty.
1 Boring and facing machine.
1 Potter Johnson machine, or equal.
1 Jones & Lamson machine, or equal.
Sundry lathes and drills.
Pattern shop equipment.
Foundry equipment.

Tenders

Ottawa, Ont.—Tenders are invited by the Government for the construction of what is to be the largest dredge in the world. It is to be of the bucket type, with a lifting capacity of 1,500 tons per hour, and costing $750,000.

Ottawa, Ont. — Tenders will be received up till March 3rd for the construction of a 15-inch hydraulic self-propelling steel suction dredge. Plans and specifications may be obtained from the Department of Public Works, Ottawa, Ont.

Lethbridge, Alta.—Tenders will be received up till February 9th for the installation of an electric passenger elevator to include motor, generator, etc., for a public building at Lethbridge, Alta. Plans and specifications may be obtained from the Department of Public Works, Ottawa, Ont.

Calgary, Alta. — Tenders will be received up till February 11th for the installation of one standard passenger and three standard freight elevators, complete with motor generator sets, etc., in the examining warehouse, Calgary, Alta. Plans and specifications may be obtained from the Department of Public Works, Ottawa, Ont.

Vancouver, B.C.—It is expected that the civic bridges and railways committee will be in a position to call tenders for the construction of one or more of the East End viaducts over the Great Northern tracks in the course of a month. Plans for these bridges have been received by Engineer Stewart of the Great Northern Railway Co. at Seattle.

Vancouver, B.C. — The undersigned will receive tenders up to 4 p.m., Tuesday, Feb. 3rd, for the supply of the following pipe:—3,312 feet 18-inch cast iron pipe, 12 feet lengths; 1,818 feet 18-inch cast iron pipe, 9 feet lengths; 8 junction pieces, 6 feet long, with gland fittings at one end for connection purposes.—James Stuart, City Purchasing Agent.

Winnipeg, Man.—Tenders (marked "Tenders for Rails and Angle Bars" or "Tenders for Track Sundries"), addressed to "Commissioners of Greater Winnipeg Water District," 901 Boyd Building, Winnipeg, will be received up to noon of Wednesday, February 11, 1914, for 8,500 tons of 60-lb. new or relaying rails; 400 tons of angle bars; 256 tons of bolts and spikes; 20 frogs and switch stands.

Winnipeg, Man.—Tenders (marked "Tenders for Railway Construction" or "Tenders for Telephone Line Construction"), addressed to "Commissioners, Greater Winnipeg Water District," 901 Boyd Building, Winnipeg, will be re-

Heavy Cylindrical Grinding

LANDIS

Standard sizes: 20 in. x 96 in., 20 in. x 120 in., 20 in. x 144 in., 20 in. x 168 in., also in 30 in. swings.

These manufacturing machines are adapted for straight and taper cylindrical shafts, spindles, pistons, corliss valves, plungers, tubing, and are especially desirable for grinding hardened steel and iron rolls.

Being designed as a self-contained machine without overhead obstruction makes them convenient for handling the work with a crane.

LANDIS TOOL COMPANY Main Office and Works, WAYNESBORO, PA., U. S. A.

Manufacturers of Grinding Machines for Cylindrical and Conical Surfaces

Universal Grinding Machines **Plain Grinding Machines** **Roll Grinding Machines** **Crank Grinding Machines** **Internal Grinding Machines** **Cam Grinding Machines**

Canadian Agents—A. R. Williams Machinery Co., Toronto; Williams & Wilson, Montreal.

ceived up to noon of Wednesday, February 11, 1914, for the supply of all tools and material except ties, rails and sundry steel and for the building of grade and laying of track for 85 miles, more or less, of Standard Gauge Railway, also for the supply of tools and material, except poles, and for the building of a telephone line between Shoal Lake and Transcona.

Building Notes

Montreal, Que.—The Liverpool & London & Globe Insurance Co. will build a 5-storey building at the corner of Dorchester St. and Union Ave., 50 x 100 ft.

Ottawa, Ont.—Tenders are to be called at once for erecting a new public building at Walkerville, of 100 feet frontage, with depth of 85 feet and costing $90,000.

Toronto, Ont.— Hon. Robert Rogers, Minister of Public Works, has assured the civic deputation that he will use every effort to have the contractors for various public buildings in Toronto proceed at once with the work, with a view to employing as many men as possible during the winter months.

Ottawa, Ont.—The contracts for the new public Government buildings at the Capital will be awarded in the spring of 1915, the time for the reception of the preliminary designs which was originally fixed for January 2 of this year, having been extended three months to April 2. This is the extensive scheme of buildings for which such a large area was expropriated west of the Parliament Buildings last year.

Refrigeration

New Westminster, B.C.—Wilfred Philpott will erect an ice manufacturing plant on Victoria Street.

Lethbridge, Alta.—The Southern Alberta Cold Storage Co., capitalized at $100,000, will erect a $70,000 cold storage plant. The Dominion Government has given a $20,000 subsidy.

Hamilton, Ont.—The matter of establishing a municipal ice plant in this city was introduced before the Board of Works on Tuesday, Jan. 20, by Ald. Davey. The matter will go before the council.

Medicine Hat, Alta.—William Davisson, Calgary, representing one of the largest ice-making concerns in the country, was here recently making arrangements for the erection of a large ice plant. He presented plans before the mayor and members of the council. The site has been obtained, and construction will begin early in the spring.

Wood-Working

London, Ont. — Fire last week did $1,000 damage to the dry kiln of the G.T.R. car works.

Vancouver, B.C.—The Superior Sash and Door Co. has been incorporated with headquarters here.

Montreal, Que.—The sawmill of W. Bleu, St. Zotique and Des Ecord Streets, was damaged by fire to the extent of about $15,000.

Welland, Ont. — Quality Beds, Ltd., will commence the manufacture of bedroom and living room furniture. H. L. Hatt, president and manager.

Kalso, B.C.—The Kootenay Mills, Ltd., will rebuild their mill and sash and door factory, starting about the end of January. New machinery will be installed. Secretary, R. H. Fulton, Moose Jaw.

Niagara Falls, Ont.—A. C. Collins, director of the Davis Acetylene Co., and managing director of the Canadian Automatic Parcel Checking Co. will start the manufacture of cabinets.

Chatham, Ont.—The Sutherland-Innes Co., manufacturers of cooperage stock, took over the cooperage plant of W. M. Drader, in North Chatham, last week. This plant has an annual output of about 100,000 barrels, and when running to capacity employs 100 men.

Uxbridge, Ont.—Word has been received from Mr. Osborne who owns the carving factory that he will be in town about February 1st, and will push matters in getting the piano factory started. He has sold all his stock in the piano company.

Strathroy, Ont. — The Canadian Handles Co., at a directors' meeting last week decided to re-build their factory on a larger scale if the town will grant fixed taxation and free water and light. Sarnia, Woodstock, and London are trying to secure this industry.

Niagara Falls, Ont.—River Road rink is being turned into a planing mill by Richard Smith, local contractor, who will make all kinds of molding, trim, doors, etc., for the trade. He also intends to start in the cement block business.

Beamsville, Ont.—A Western Ontario firm has been negotiating with J. W. Kennedy for the purchase of five acres of land, north of the G.T.R. tracks, east of the station for the erection of a factory, for the manufacture of wood specialties for fruit farmers. The object is to get a location where they will have access to both the G.T.R. and C.N.R. railroads.

General Industrial

London, Ont.—The Cook-Fitzgerald Shoe Co. is extending its plant.

Grand Forks, B.C. — The ratepayers have voted in favor of aiding the local cannery.

Lindsay, Ont.—Horne Bros., William Street, are planning improvements to their woollen mills.

Hamilton, Ont.—H. Schure, 14 Crooks Street, will erect a four-storey soap factory, 30 x 100 ft., costing $12,000.

Stratford, Ont.—The Avon Hosiery Co. have prepared plans for an addition, costing $10,000. Thos. Hepburn is architect.

Welland, Ont.—T. J. Costello, of Buffalo, has made a proposal to establish a co-operative automobile tire manufacturing company in Welland.

Hamilton, Ont.—F. W. Bird & Son, makers of roofing paper and branch of an American firm, are making extensions.

Toronto, Ont.—Chas. Wilson, Ltd., manufacturers of ginger ale, have awarded the contract for additions to plant.

Gowganda, Ont.— A three-drill compressor and accessories have been purchased by the Hewitt Lake Mining Syndicate of Gowganda.

Regina, Sask.—A 900-foot steel passenger bridge will be built over the C. P. R. tracks at Hamilton Street, this year. It will cost $35,000.

Sarnia, Ont.—The Imperial Oil Co. is installing a new waterworks plant for its factories. The pumps will have a capacity of 14,000,000 gallons.

Petrolia, Ont.—The Canadian Oil Refinery will be doubled in capacity. The new wax works is nearly finished, and a new grease works is to be built immediately.

Edmonton, Alta.—J. H. Lavellee Co., want a site here for a factory in which to manufacture asphalt mastic for waterproofing and flooring, roof paints, shingle stains and bridge paints.

Bridgeburg, Ont.—Dr. Ramage, president of the International Chemical Co. of Canada, is in England negotiating for foreign sales, and arrangements for building a factory here will not be made until his return.

Cobalt, Ont.—The Hollinger directors have decided to start diamond-drilling their mine to a depth of three thousand feet. It is reported that the Hollinger mill will be doubled in capacity within the next few months.

Fire Insurance Companies

acknowledge the efficiency and dependability of

MANUFACTURERS' AUTOMATIC SPRINKLERS

by reducing Rates about 80 Per Cent.

These sprinklers are firemen and watchmen that are always alert.

They quickly extinguish a blaze before it gets any headway.

They will pay for themselves in five years with the large saving they effect in premium rates.

Will be pleased to furnish you with estimates on equipping your old or new plant.

Our Loose Pulleys and Friction Clutch Pulleys

CAN NOT RUN HOT

The application of **Chapman Double Ball-Bearings** to **Loose Pulleys** and **Friction Clutch Pulleys** has solved one of the burdensome problems in manufacturing lines; yet there are manufacturers who are still fighting the many evils connected with the ordinary type of Loose Pulley and Friction Clutch Bearings. We can prove to you that the **Chapman Ball-Bearings** is a complete solution of this difficulty.

One of the principal difficulties met with in the ordinary type of Loose Pulley and Friction Clutch Pulley Bearing is that the centrifugal force tends to throw the oil away from the Shaft, which means that, unless constant attention be given to the Bearing and daily application of the oil-can, the Bearings very soon run hot; sometimes cutting the Shaft and requiring both Bearing and Shaft to be replaced in a short time. Another important item is the keeping of the Belt free from the oil which is thrown off by the Pulley; this also, if not attended to, means a new Belt in a short time. Compare this with **Chapman Ball-Bearings**, which require attention only twice a year at most, when a little vaseline is put in. **No other oiling is required.** The **Chapman Ball-Bearing Sleeve** is clamped firmly to the Shaft, which protects it from wear. In fact, as already stated, the application of **Chapman Double Ball-Bearings** is a **complete solution** of the hot-box evil connected with the ordinary Loose Pulley or Friction Clutch Pulley.

Examine the conditions of some of your Loose Pulleys or Friction Clutch Pulleys and find out what they are costing you for attention and lost time alone, and compare it with the price of a Chapman Ball-Bearing Pulley.

Our Clutch Pulley Bearing is thoroughly standardized, and may be adapted to any of the standard Friction Clutches without any or little change.

WRITE US FOR PARTICULARS AND PRICES

The Chapman Double Ball Bearing Co.

339-351 Sorauren Avenue, TORONTO

Cochrane, Ont.—The International Exploration Co., Buffalo, will exercise their option on the LeBlanc property, at Keniwisek, near Hurricanaw, between now and May 4. Machinery will be taken in when navigation opens.

Ottawa, Ont.—It is stated on good authority that the deal between Messrs. Mackenzie & Mann and Sir Rodolphe Forget, whereby the former are to secure control of the Quebec & Saguenay Railway, has been finally put through.

Waterloo, Ont. — The prospects for ratifying the by-law granting aid to the Quality Mattress Co., are at present bright. A reply favorable to the scheme of aiding the Company has been received from Provincial Secretary Hanna, who was asked about the legality of the measure.

Toronto, Ont.—The Canadian Seamless Wire Co., the Pratt Food Co., the J. W. Hewitson Shoe Co., the Automatic Electric Cooking Co., and Richard Russell., suffered losses to their plants totalling $55,000 in a fire last week. The Automatic Cooking Co. lost $3,000 worth of electric stoves.

Listowel, Ont. — Mayor Climie says Herman Steier, Chicago, mechanical engineer for a condensed milk firm, has been here choosing a site, and drawing plans for a factory. Listowel will be made the central plant for several outlying condensing stations. The company will spend $60,000 in buildings and plant.

Montreal, Que.—The temporary financing of the Canadian Coal & Coke Co. is said to be practically completed. The proceeds of the $3,000,000 bonds will cancel temporary financing and provide funds for extensions of works, etc. At the present time, the collieries are turning out about 1,200 tons of coal a day.

Berlin, Ont.—Berlin and Waterloo will ask the Hydro-Electric Commission to report on the feasibility of building a

radial railway to the north and southwest. The north line, as proposed, will extend to Wellesley. The other line is to Woodstock, via New Dundee and Plattsville.

Municipal

Lethbridge, Alta.—The Government will probably erect a terminal elevator here this year.

Steelton, Ont.—The town council will probably be in the market soon for waterworks pumps.

Oshawa, Ont.—Motor-driven turbine pumps are about to be purchased for the city waterworks.

Esquimault, B.C.—A market has been found for $50,000 of the $400,000 worth of debentures for the sewerage system.

Outremont, Que.—Town Engineer Duchastel will prepare plans for a new fire station. The department will be reorganized.

Knowlton, Que. — The water system will be extended in the spring. A new fire alarm system is also being considered.

Toronto, Ont.—A cement roadway between Hamilton and Toronto will be constructed at a cost of between $500,000 and $600,000.

Eastview, Ont.—Chief Graham of Ottawa recommends the village to purchase a chemical fire engine and extinguishers. These will be bought.

Ottawa, Ont. — Considerable damage was done to Howick Pavilion, a large cement and steel structure, by the explosion of a boiler on Jan. 21.

Aylmer, Que. — The corporation has been authorized to borrow $15,000 for the extension of the intake pipe of the waterworks system, 2,000 feet further into the lake.

Winnipeg, Man. — Improvements to Well No. 2 will be made, and they will cost $2,500. The city engineer advises that the well be increased in depth by 20 to 30 feet, and that it be operated by electricity.

Hamilton, Ont.—Chief Ten Eyck recommends new fire alarm system, and the purchase of two quick-raising aerial hook and ladder trucks, two motor tractors, two automobiles, and a 750-gallon steam fire engine (motor tractor).

Hamilton, Ont.—Mayor Allan and the controllers have decided to appeal to the Legislature for permission to raise money for the purchase of a quarry and equipment, costing $80,000. The committee has three or four offers under consideration.

Hamilton, Ont.—City Engineer MacCallum does not favor building reservoirs to hold 120,000,000 gallons, and the installation of steam pumps to replace electric purposes. He recommends a steady extension of the waterworks along the lines that have been followed for three years.

Calgary, Alta.—A waterworks scheme involving an expenditure of in the neighborhood of $2,000,000 will eventually be entered into by the city as a result of a report made to the council by A. W. Fawkes, municipal water engineer. Mr. Fawkes recommends the establishment of great storage dams on the Elbow river which brings ice cold water from the Rocky Mountains right to the city. It is proposed to construct these dams at sites to be selected, varying in distance from Calgary of 32 to 39 miles. The water would then be conveyed to Calgary by gravity pipelines, saving the necessity of doing any pumping at all and largely reducing the cost of operation.

Contracts Awarded

Montreal, Que.—Contracts have been let for the building of 25 new G. T. R. locomotives at a cost of $500,000. Most of them will be built in Montreal.

Vancouver, B.C. — The Canadian Northwest Steel Co. has received from the G.N.R. the contracts for the construction of the viaducts over two cuts which the railway has made through Grandview, across Victoria drive and Broadway.

Toronto, Ont.—The contract for structural work on the new plant of the Methodist Book Room, has been let to John H. Parker, Canadian, Ltd., of New York, whose Canadian office is at 8 Colborne Street, the price being just about $600,000.

Vancouver, B.C.—The contract was awarded last week at Ottawa to Snider Bros. & Brethour for the construction of the new immigration detention building at the foot of Thurlow Street on Burrard Inlet. The contract price for the building is $277,440.

The Dominion Dredging Co., Section No. 1, New Welland Ship Canal, received a new locomotive, No. 5 last week, which was manufactured by the Vulcan Iron Works, of Wilkes-Barre, Pa., and delivered by Mussens, Ltd., of Toronto and Montreal, the Canadian agents.

Montreal, Que.—The Canada Steamship Lines has given a contract to George T. Davie, of Levis, for the building of a new ferry boat to replace the Longueuil, now plying between Montreal and Longueuil. The vessel, which will be 175 feet long 44 feet beam, and drawing eight and a half feet, will have accommodation for a thousand passengers and 50 loaded teams. She is to be delivered in July of this year. The hull is to be of steel, designed to be used when needed as an icebreaker, so that the ferry service may be started earlier and continued later in the season.

Marine

North Vancouver, B.C.—A by-law authorizing the purchase of the Ferry Company was passed recently.

The Northern Navigation Co. will hold their annual general meeting in the company's office at Sarnia, on Thursday and Friday, Jan. 29 and 30.

Three Rivers, Que. — The ferryboat Glacial, plying between Three Rivers, and the G.T. Ry. station at Doucet's Landing, was struck on January 2 by a large piece of ice and sank near Commissioners' Wharf.

Ottawa, Ont.—Improvements to the St. Lawrence route, to the extent of a couple of million dollars are in the estimates shortly to be tabled. No less than fifteen large dredges will be working next year, mainly between Montreal and Quebec, and two of these will be the new dredges now completing at Collingwood.

Railways—Bridges

Morrisburg, Ont.—The Morrisburg & Ottawa Electric Railway Co., are asking for right-of-way through the town.

Toronto, Ont.— Ontario Hydro-Electric engineers have started work on a survey of the proposed radial line between Guelph and Owen Sound.

Hamilton, Ont.—The works committee have received an application from the East End Incline Co. for the right to extend the incline landing further north.

Greenbank, Ont.—A public meeting was held on Jan. 9th to discuss means to obtain continuation of the proposed Municipal Electric Railway from Uxbridge or to Port Perry.

Berlin, Ont. — The city council will ask the Hydro Power Commission to prepare a report on the probable cost and feasibility of an electric line from Berlin to Woodstock, via New Dundee, Plattsville and Tavistock.

Ker & Goodwin
Brantford, Canada

St. Catharines, Ont.—The Dunnville, Wellandport & Beamsville Electric Railway Co., will apply to the Legislative Assembly for an Act extending for two years the time for the completion of and putting into operation the work of said railway.

St. Catharines, Ont.—Work has commenced on the new bridge on the Welland Division of the G.T.R. crossing of the canal between Lake street and Geneva street bridges. The new bridge is being put together by the Hamilton Bridge Company.

Ottawa, Ont.—Hon. Frank Cochrane, Minister of Railways, has given notice of a resolution to extend for one year the time allowed for the completion of the prairie section of the G.T.P., and the taking over of the eastern section of the National Transcontinental.

Trade Gossip

The Stratford Light and Heat Commission, in their annual statement, report a net surplus of $10,218.

Watsons, Limited, makers of wire screens, expect to open their plant at Bradford, Ont., in February.

L'Air Liquide Society, Toronto, will begin to manufacture oxygen and liquid air at their new plant on Boler St. this week.

Edmonton Technical School requires instructors in applied mechanics and steam, and in electrical work, for two evenings each week, and will pay $4 per night.

The New Brunswick Wire Fence Co. held its annual meeting on Monday, January 19, W. K. Gross, president, in the chair. Favorable reports were presented.

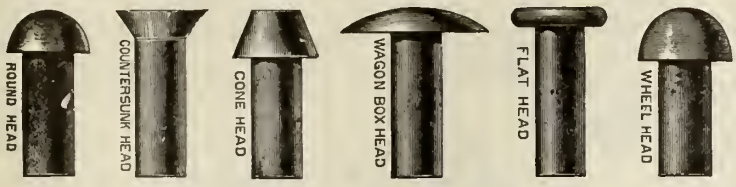
Carriage Factories, Limited, held their annual meeting in Montreal, January 20, James B. Tudhope, Orillia, president, in the chair. The annual report showed a considerable increase in business done.

The Armstrong Whitworth Co. of Canada will commence operations in their new plant at Longueuil, Que. about June 1, according to M. J. Butler, the general manager. Sir Percy Girouard, the president, will come to Canada in April.

Brick Yards to be Busy.—Ontario brickmakers think 1914 will be a good year for building. Many orders are coming in for brick, and it looks as though there will be more construction work than last year.

The International Harvester Co.'s tool room employees, Hamilton, held their second annual banquet in the Vancouver Hotel, last Thursday evening. P. Masterman was in the chair at an entertainment which followed the supper.

J. C. Mackintosh & Co., brokers, Montreal, who are as a rule reliable prognosticators, say: "There is no further talk at the moment of increased duties or renewal of bounties; but in some quarters the opinion is held that free wheat will be granted the western farmers, and to offset this, assistance in some form will be given the iron and steel manufacturers."



The National Steel Car Co., Hamilton, will hold their first annual meeting some time in February, when a definite statement of the year's earnings will be presented. It is understood that these have been in excess of the amount of the preferred dividend. Very few of the railway companies have placed any orders in the last six months, despite their acknowledged requirements.

Senator Mason, moving the address in reply to the speech from the throne in the Upper Chamber at Ottawa, last Tuesday, remarked that there was one item in Canadian imports with which he was not altogether satisfied. That was the importation of iron and steel to the value of $140,000,000. Canada had iron, coal and men, and should be able to provide this commodity from her own natural resources.

Edmonton, Alta.—The Edmonton Iron Fence and Wire Works want to purchase a site on Shand Avenue to sell to the Magnetic Wheat Co. The land required is about half an acre and the wire works will enlarge their own plant because they are at present too cramped, while the Magnetic Wheat Co. will use the remainder of the property to establish a plant for themselves.

The "Bitumastic" enamel and solution, manufactured by Wailes, Dove & Co., Newcastle-on-Tyne, England, is being handled in Canada by the Canadian Bitumastic Enamels Co., Toronto. The enamels is employed extensively for coating the interior surfaces of vessel bunkers, holds, engine and boiler-room tanks, bilges, etc., and is used by many of the largest ship and bridge builders in Great Britain and the United States.

The Department of Public Works, steam boiler branch, of the Province of Ontario, have issued a booklet containing a list of boiler manufacturers whose designs have been accepted, and a list of accessories, with the manufacturer's name, which have been approved by the Department. Mr. D. M. Medcalf, the chief boiler inspector, advises us that 608 different designs of boilers and fittings have been approved up to date.

We manufacture Rivets of every description, ½ inch dia. and smaller.

Economizing?

Suppose you are?—everybody seems to be these days.

If that's the case then, it's up to you to economize in the small things as well as the large ones, and to remember that buying cheap files is **not** doing so. For there's no economy in saving a few pennies on the first cost of the files, and buying inferior ones, which don't give more than 50% of the service that you will obtain from clean-cutting, long-lasting, crucible steel.

Delta Files

Nor is there any economy in giving your men inferior files, and causing them to waste more time in one day than the whole cost of the "Delta" required to prevent it.

So, when you start economizing, be sure to see that everybody is equipped with "Delta" files, and you'll find that the cut in the pay-roll—the place where the economizing should take place — will surely happen.

But, "Delta's" reputation is so enviable that some people have tried to cash in on part of it, so remember to look for this trade-mark on the tang.

The Wheeler Condenser and Engineering Co., of Carteret, N.J., have opened an office at 122 Board of Trade Building, Montreal, which will be under the management of Mr. Jos. McKay, jun., who has been for several years New York manager. The Wheeler Company makes a specialty of surface and jet steam condensers complete, with auxiliaries for all conditions. Its product consists, in addition, of forced and natural draft water cooling towers, feed water heaters, evaporating apparatus and special castings for chemical industries.

Fort William Board of Trade has called upon the Government to resume the bounties on iron and steel that existed from 1907. These bounties consisted of a bounty of $2.10 and $1.10 respectively upon the proportion of pig iron manufactured in Canada from Canadian and foreign ores, this being gradually reduced in four years to ninety cents and forty cents in 1910. Further bounties are asked for on puddled iron bars from pig iron made in Canada of $1.65, reduced to sixty cents in four years; a bounty of six dollars per ton on rolled iron rods made of fifty per cent. Canadian pig, and a bounty of $1.65 on steel made from fifty per cent. Canadian iron, reduced in four years to sixty cents.

The York Manufacturing Co., makers of ice-making and refrigerating machinery, York, Pa., have recently made the following installations:—The Canadian Oil Companies, Toronto, one 50-ton absorption refrigerating machine complete, also one 50-ton shell and tube brine cooler, at Petrolia, Ont.; B. Slattery, Ottawa, one 11-ton vertical, single-acting, belt-driven, enclosed type refrigerating machine and high pressure side complete, in the By-ward Market; McCutcheon Bros., Berlin, Ont., one 4-ton vertical, single-acting, belt-driven, enclosed type refrigerating machine and high pressure side complete; the Bay Tree Hotel, Toronto, a 1-ton vertical, single-acting, belt-driven, enclosed type refrigerating machine and high pressure side complete; the Monkton Creamery Co., West Monkton, Ont., one 2-ton vertical, single-acting, belt-driven, enclosed type refrigerating machine and compression side complete; the Swift-Canadian Co., Ltd., Toronto, two 50-ton coil-less freezing systems.

To Users Of ELECTRICITY

The total cost of lighting (current and renewals) by carbon lamps is three times that for Elmain Efesca Wire Lamps, which means that without increasing your total cost for lighting you can increase your illumination three times.

Spoilage alone with the average manufacturer is a considerable item. 75 per cent. of this occurs under artificial light.

The Elmain Efesca Wire Lamp is made to our order by one of the most famous English manufacturers, and its life is exceptionally long.

Special prices in case lots.

When your electric equipment breaks down consult us. We'll minimize your delays by sending a competent man immediately upon request.

Jot down our phone number where you can see it at a glance. Our service means economy for you.

H-22, 20-ton Jack on 15-in. Steel Base.

THIS is our 20-ton jack mounted on 15 in. Steel Base, is 22 in. high, rise 11 in., can be detached from base and used in the ordinary way.

Loads of half the rated capacity of the jack can be raised on the foot from within 3 in. of the ground.

For raising or moving buildings, heavy machinery, loaded cars, or anything in the tons to handle, this jack will be found ready, reliable, convenient and quick in operation. Working parts protected, and can be practically run in oil while the outside is always neat and clean.

Manufactured by
Canadian Brake Shoe Co. Ltd., Sherbrooke, Que.
Successors to
The Canada Lifting Jack Co.

Elastic Rotary Blow Riveter

ONE TAKES THE PLACE OF FOUR

One of our Riveting Machines is doing the work of four hand operators and doing it BETTER. The work is uniform; just as good at 6 P.M. as at 8 or 9 A.M.

Figure up the profit at the end of the year. Can't you save as much? Send us samples of your work, and let us help you.

An Extraordinary Drill Made by An Extraordinary Process

The only marked advance that has been made in twist drill manufacture in a quarter of a century is found in the process by which Wilt Twist Drills are made—The entire Drill is completed at a single chucking. Absolute uniformity and accuracy are thus assured.

Try Wilt Twist Drills on your hardest job. Note the clean-cut clearance—the scientific contour of the grooves. Note the way they stand up to their work, and the amount of work they do without regrinding.

Ask Your Supply Man—or Write Direct.

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

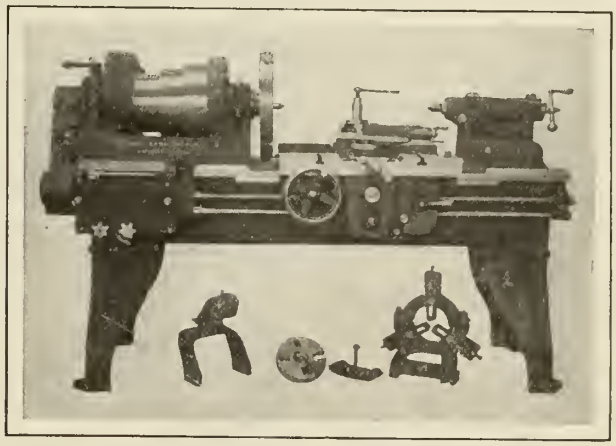
"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.
New York CLEVELAND, OHIO Chicago

Modernize your factory by using

"Dennisteel" Lockers



They are the very latest product in Locker design and construction.

They contain the maximum strength requisite for Locker purposes. **Made of special Steel, with angle Steel Frames.**

They promote order and system, are cleanly, and improve the appearance of your workroom.

Catalog and full particulars on request.

Dennis Wire & Iron Works Co., Limited
LONDON, ONTARIO

The Mueller Heavy Duty Lathe is built to meet the severest requirements of the modern shop. It is a highly accurate tool and easy to operate. All gears on it are made of steel and cut from the solid with special cutters. Phosphor bronze bushings throughout.

We can recommend the MUELLER Heavy Duty Lathe to anyone in need of a high class lathe, for either tool-room or manufacturing purposes.

Ask us to tell you about the many good features of this machine and the cost of it under your line shaft.

1,000 lbs. on the Table of the No. 5B Heavy Plain Milling Machine

Casting as it is fastened on machine is 25 in. high and extends 35 in. out from cutter. Work and fixture combined weigh about 1,000 lbs. The B.&S. Inserted Tooth Face Mill is 26 in. in diameter.

Put Your Big Jobs on This Machine. It is Built for Heavy Service.

Capacity 50 in. x 12 in. x 21 in.

Analyze the quality, then the material, then the workmanship. The result will make a lasting impression, for you have combined all the essential points that make popular

"MORSE" DRILLS

SATISFACTION GUARANTEED

Food for thought in this statement—think it over.

The different kinds and styles of *"Morse" Drills* are illustrated in our Catalogue, a copy of which is yours, if wanted.

Also

Reamers, Cutters, Taps, Dies, etc.

Rivett Bench Lathes

No. 3½ Lathe

Length of bed	**32 in.**
Distance between centers	**18 in.**
Swing	**7 in.**
Spindle Capacity	**½ in.**

Have you ever used a Rivett Lathe? If not you have a Surprise coming to you!

Accuracy? Highest obtainable!

Strength? Plenty of it and for all-round handiness they cannot be beat.

The Cut shows the smallest Lathe of this type made by us. It is just the machine for those experimental jobs you want to take up first chance you have. You want for such work a Machine on which you can depend for Accuracy.

Drop us a line now!

QUALITY
ALUMINUM BRASS

We specialize in Pulp Mill Acid-Resisting Castings of all kinds.
Best equipped foundry in Canada.
Capacity 20.000 lbs.
Can make castings up to 5,000 lbs.

ALUMINUM CASTINGS
Limited
Ottawa, Ont.

CASTINGS

You May Have This Book Without Spending a Cent

if you are a subscriber to "Canadian Foundryman," by sending in to us four new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.

Foundry Work

By Wm. C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with four yearly paid-up subscriptions.

The subscription price is fifty cents per year; two years for one dollar.

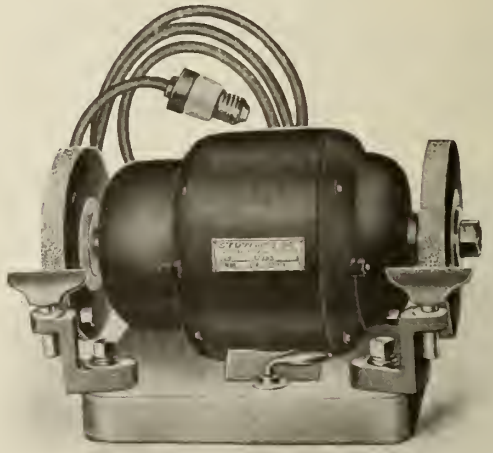
Wrenches, Ratchet and Basin.
Bemis & Call Hardware & Tool Co., Springfield, Mass.

Repeat orders are the best evidence of a superior tool.



"ERIE" DOUBLE FRAME STEAM FORGING HAMMERS are correctly designed and so well built that repeat orders come to us as a matter of course.

Let us point out to you some of the exclusive and superior features of the "ERIE" HAMMERS.

Erie Foundry Company, Erie, Pa.

ELECTRIC BENCH GRINDER

You will find it the handiest tool in your Shop!

We are now prepared to supply them as follows:

No. 1, 1/6 H.P., A.C., capacity two 6 x ¾ in. Emery Wheels.
No. 2, ¼ H.P., A.C., capacity two 6 x 1 in. Emery Wheels.
No. 2, ¼ H.P., D.C., capacity two 6 x 1 in. Emery Wheels.
No. 3, ½ H.P., D.C., capacity two 8 x 1 in. Emery Wheels.
No. 4, 1 H.P., D.C., capacity two 10 x 1 in. Emery Wheels.

STOW MFG. CO.
BINGHAMTON, N.Y., U.S.A.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia

Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.

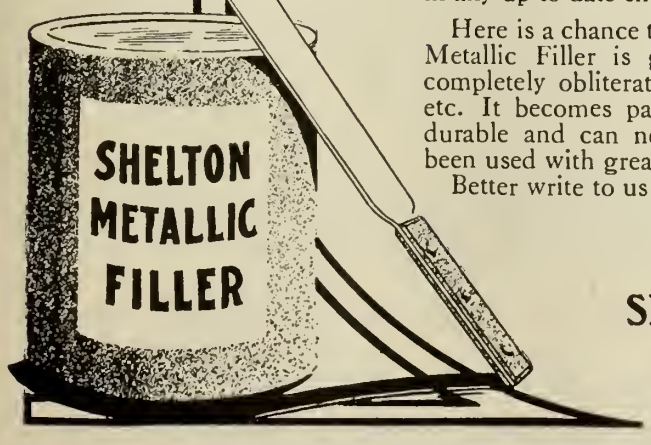
A sign of good profits



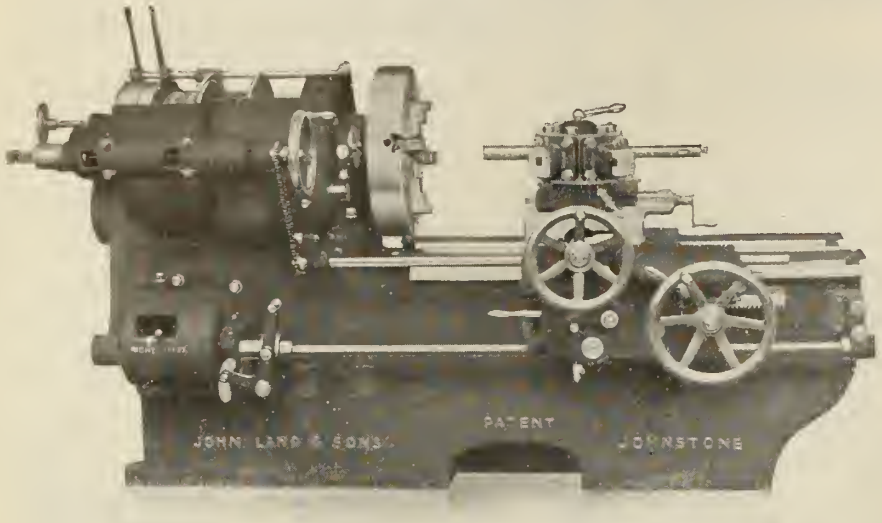
FOR YOU--FOR EVERY FOUNDRYMAN

Shelton Metallic Filler

is a guarantee for *bigger results* in any foundry —it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years. Better write to us at once.



Every casting means a profit if you are a user of SHELTON METALLIC FILLER
At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed. Write us.

Chester B. Hamilton, Jr., B.A.Sc., Mechanical Engineer.

The Hamilton Gear & Machine Co.

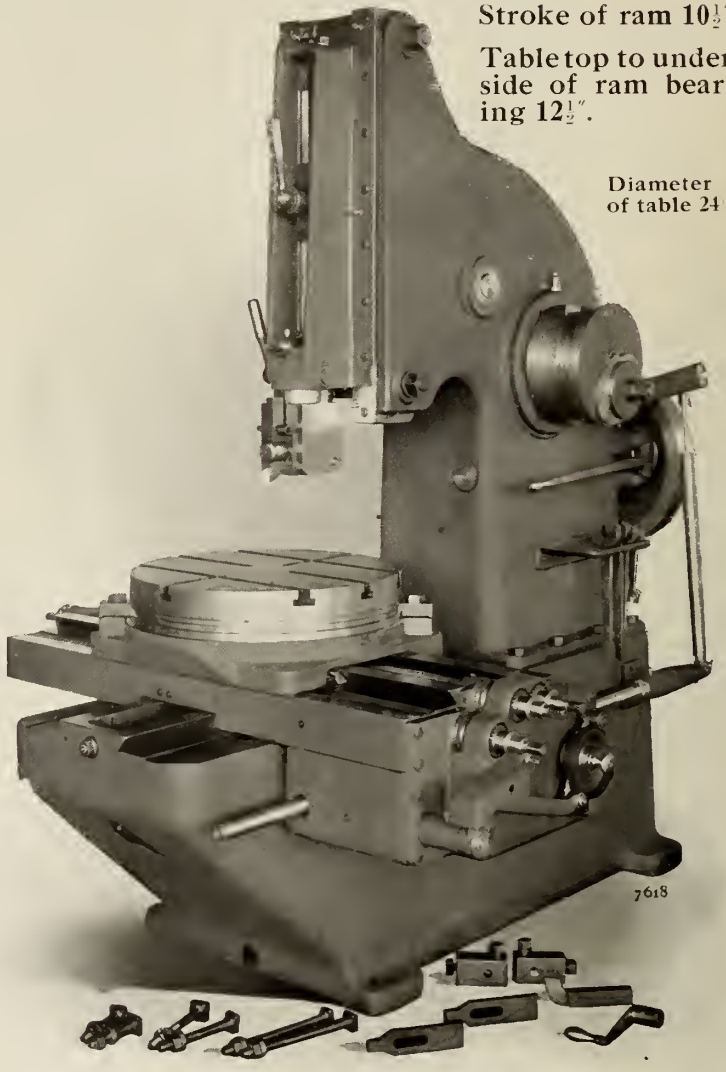
Cor. Concord and Van Horne, TORONTO

Larger Size Vertical Shaper

New Model with 10½" Stroke of Ram

Perhaps you have some work which you realize is not being handled as efficiently as possible because it is too large for the 6 in. Vertical Shaper. For this work we have designed the

New 10" P. & W. Vertical Shaper



Differs from 6" Machine in Some Features

Power Rotary Feed. The 10" Vertical Shaper is provided with power rotary as well as longitudinal and transverse power feeds.

Compact Feed Mechanism. The entire feed mechanism is self-contained in one compact unit on the right side of the saddle. The longitudinal, transverse and rotary power feeds are conveniently engaged, disengaged and reversed from this unit.

Powerful Worm and Wheel Drive.

Power is applied to the ram through a powerful worm and worm-wheel drive.

Why the Vertical Shaper Should Appeal to You

In the first place it is a machine of great range and you should never have any difficulty in keeping it busy. It will handle efficiently both slotting machine and horizontal shaper work in addition to work for which its distinctive features make it particularly adapted.

With the angular adjustment of the ram, this machine is in a class by itself on die work, convex, concave and irregular surfaces.

Swiveling ram head enables tool to be set in most convenient position; also various sides of work can be machined at one setting and with much greater accuracy than possible on horizontal shaper.

Although machine is proportioned to give unquestioned stability and provided with ample power for every requirement, it is a precision tool of great accuracy. The cutting stress holds the table and slides together and there is no tendency for the table to yield as on the horizontal shaper.

The entire control is within easy reach and conveniently operated.

Ram may be started and stopped independent of driving motor by means of clutch.

NICHOLSON MADE

FIRST—

Get the NICHOLSON-Made File That Best Suits Your Work.

THEN—

Use More of Them.

A dozen wrong-type files won't give you half the satisfaction of a single file that's right for your use.

When you specify NICHOLSON-MADE FILES, you simply can't go wrong.

Over 4,000 distinct patterns and sizes make it an easy matter to get the RIGHT file for your work.

And a NICHOLSON-MADE FILE represents the highest possible efficiency for its type.

Made from the RIGHT grade of steel—
Cut on our own special-built machines—
Inspected and tested after every important operation—
Embodying the results of 50 years in making great files,

each NICHOLSON-MADE FILE is a tool of matchless efficiency and economy in its particular field.

To get MAXIMUM File Service, use NICHOLSON-MADE FILES. To get the MAXIMUM service from NICHOLSON-MADE FILES, discard them as soon as they become half-worn.

The extra expenditure of 15c for a new file generally means a $1.50 saving in labor and time.

Schuchardt & Schutte, 307 Coristine Bldg., Montreal

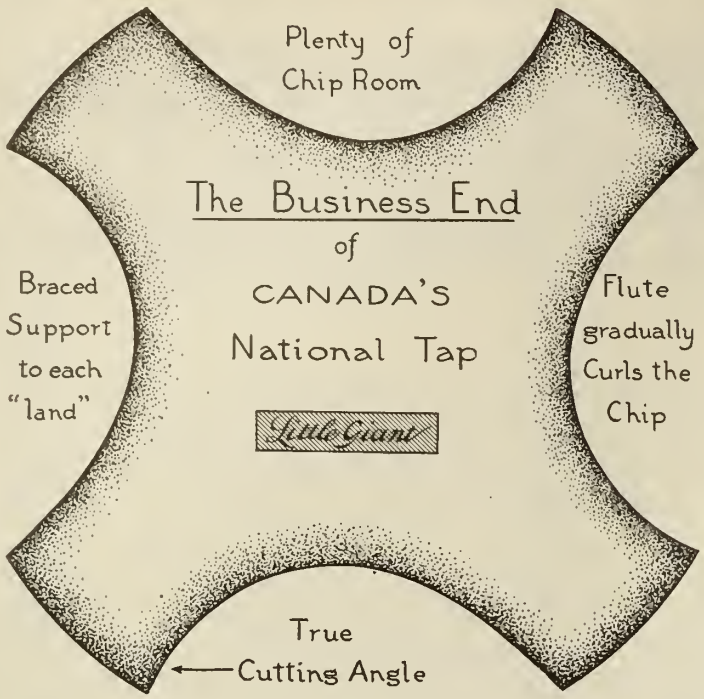
Starrett Hack Saws

It is as useless to expect good service from a hack saw made for cutting cast-iron, but used on brass tubing, as it is to expect a good yard-stick to replace a micrometer for fine measuring. You have got to suit the tools to the work.

That's where the Starrett line of hack saws fits strong—because there's a Starrett for every job. No matter what the work—cutting steel shafting, tubing, pipe or casting, there is a Starrett just suited to that kind of cutting and it will cut quicker and last longer than any other saw.

Every Starrett is made of the finest tungsten steel, which gives great hardness without brittleness. The teeth are **milled** evenly and set perfectly so that each tooth does its proper share of the work. Starrett hack saws are made in suitable lengths and sizes for all hand and power cutting.

Starrett Tools and Hack Saws are sold at all good hardware stores.



Send for our big, new, free catalog No. 203. See our styles and prices and learn how you can save on your hack saw costs.

The "Demi-Tasse" of Life

The things of least importance are the things to which we give most concern. Things of least consequence are the ones about which we become most excited and most perturbed. About ninety per cent. of the average conversation of the average man and woman is devoted to the color of ties, the advisability of ending the meal with a demi-tasse, and as to whether ice cream is a better dessert than plum-pudding.

On the reading table of the average individual you find the "demi-tasse," the trash which has emanated from the mind of some idle dreamer who has never produced anything of importance and who has accomplished nothing useful. These books and their trivialities are discussed at great length and with great seriousness.

To the average man and woman the purpose of time is to discuss or repeat "what he said" and "what she said" at the card game or at the pink tea the day before. It seems to me that the most important part of the day is from six o'clock in the morning until ten, as these are the hours during which we who intend to do anything must find our balance and get our stride,—and these are the hours during which we not only accomplish our best work, but during which we prepare ourselves for the rest of the day.

We are too much inclined to worry and vex ourselves about the little things, too much inclined to devote long and extended discussions to matters which do not really differ, to subjects which are of no concern. In doing this, we, of necessity, leave un-discussed and unstudied the important truths, the fundamental facts that are really worth while.

If someone makes a mistake or breaks a dish, that is not any reason why we should expend a hundred dollars' worth of energy in becoming angry. Yet it is such things as these that use up our power of production, that destroy our dispositions and that make the biggest and heaviest demands on our energies.

In looking over material among men—in searching for those who measure up to higher and better standards,—in attempting to secure the services of men who are alert, men with initiative, enthusiasm and originality, we are driven more and more to the conviction that most of us have wasted our lives in discussing the demi-tasse and wiggle-tail affairs of life.

There is nothing in the world so prevalent and so contagious as "the microbe of gossip," which is constantly at work cultivating the "malady of meddling," the "disease of delving into the personal business of our friends and our neighbors."

Nature has worked a million years, and possibly much longer, to produce a race of INDIVIDUALS, and during this process Nature has abandoned many of her schemes and has left many forms of animal and plant life to perish—and we will never produce the ideal race of men and women until we have produced a race of individuals who have a religion that consists of performing SERVICE instead of meddling and making trouble.

My heart goes out to the man who is lost in the work he is paid to do—who is conscious of nothing except that for which he has sold his services. Whether that man is welding a rivet in the structure of a sky-scraper, whether he is painting a tower, or working in tile, whether he stands at a saw in the mill or at a wheel in the shop, whether he is writing a book, or painting a picture—my heart goes out to that man whose mind, whose soul and whose religion are riveted through and to the thing he has selected as his part in the Scheme of Life.

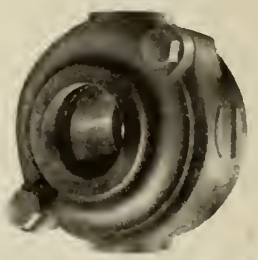
CANADIAN FAIRBANKS-MORSE CO. LIMITED
CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

Maximum Service with Minimum Repairs can be secured from any Mack Truck that we recommend for your work.



The most economical results can only be obtained when the truck is chosen to suit your particular requirements.

The great power and durability of Mack Trucks enable them to give that maximum service so necessary to economical operation.

Our Motor Truck Experts are thoroughly familiar with Canadian conditions and will be glad to study your conditions. We will be quite frank, and if we find that conditions do not warrant your purchasing a truck we will not hesitate to tell you so.

There are a great many firms who could use a Truck to advantage. Let us help you.

Skefko S.K.F. Ball Bearings.

At Canada's Departmental Home for Mechanical Goods you can secure practically every thing you need from a Motor Truck to a Ball Bearing. If you need any Transmission Supplies, New Machinery Equipment, Steam Goods, Small Tools or Scales, let us quote on your specifications.

Ship-Building Plant of M. Beatty & Sons, Ltd., Welland, Ont.

Staff Article

The development of the Canadian ship-building industry on our Great Lakes will necessarily be synonymous with the coming into larger prominence of the firm of M. Beatty & Sons, Ltd., Welland, Ont., and a perusal of the accompanying description of the Beatty plant will be sufficient evidence that their location and equipment are not only prepared for opportunity, but are contributory to it.

IN the year 1862 the firm of M. Beatty & Sons was established at Welland, Ont., for the purpose of carrying out shipbuilding and general engineering work. The volume of business became greater than the old plant could take care of, so a site covering about 12 acres was purchased in Welland, alongside the canal, a new plant erected and manufacturing commenced in 1906. The location for a plant of this description is good, being on the highway between the Great Lakes and the St. Lawrence River, and also being connected with the Grand Trunk Railway System. Cheap power is also available from the Cataract Power Co.

VIEW OF SHIPYARD FROM WELLAND CANAL—M. BEATTY & SONS.

General Layout Features.

All the buildings are of reinforced concrete construction and of modern design. They are well equipped to take care of the various products manufactured by the Company which include dipper dredges, steel scows, drill boats, hoisting engines, power derricks, etc. The buildings are amply large to allow for a considerable expansion in the volume of business, and are equipped for the introduction of new specialties when desired. There are at the present time two shipbuilding berths in service, and a new berth is in contemplation, on the completion of which it will be possible to build ships suitable for trading on the Great Lakes. A standard gauge industrial track system connects the various shops with each other and also with a siding from the G. T. R. main line. This system in conjunction with the layout of the various buildings, considerably facilitates the handling of both raw materials and product, thereby keeping operating expenses down and increasing the efficiency of the whole organization.

Shipbuilding Plant.

As already stated, steel scows and dredges form the most important products in the shipbuilding department. For the production of these, there are two berths, each being 270 ft. long by 50 ft. wide, and equipped with an overhead hand-operated traveling crane having a capacity of 10 tons and a span of 50 ft. The cranes operate the full length of each berth and were supplied by the Shaw Electric Crane Co., Muskegon, Mich. The berths lie at right angles to the canal and have sufficient slope for launching purposes. In the yard adjoining the berths, plates and structural steel are stored. Here, also, is installed a hand-operated gantry which operates over a standard gauge track. Compressed air is piped to connections located at various points near the berths and several rivet-heating furnaces are installed.

Boiler and Blacksmith Shops.

Alongside the shipbuilding berths is the boiler shop which is 200 ft. long by 60 ft. wide and has a standard gauge track running down the centre. In this shop all plate and other heavy work is done in connection with the shipbuilding plant and a part is used for laying out the moulds. The boilers for the hoisting engines are made in this shop.

The equipment in the boiler shop consists principally of two 10-ton hand-operated overhead travelling cranes made by the company; a "Hanna" pneumatic riveter with a 10-ft. reach and capable of exerting a pressure of 90 tons. This machine is used principally for boiler work. For bending plates there is a set of plate rolls 9 ft. 6 ins. long, made by the company. There is also a horizontal 42-in. plate punch and a "Bertram" 12-ft. radial drill. Jib cranes are installed with the larger machines.

The blacksmith's shop adjoins the boiler shop and is 100 ft. long by 50 ft. wide. In this shop are six fires equipped with an exhaust system for carrying away the smoke, etc., and in connection with this system is a motor-driven

"Sheldon" fan. At each fire is installed a jib crane equipped with a Yale & Towne one-ton chain block. There is also a 50-ton "Chambersburg" steam hammer, a "Champion" power hammer by the Beandry Co., Boston, Mass.; and a bar shear capable of handling stock up to 1¾ inches square and 2 inches round, supplied by the New Doty Mfg. Co., Janesville, Wis.

Adjoining the blacksmith's shop and at the south side are two storages, one on each side of the track. These are used for storing bars, etc., and steel plate respectively.

INTERIOR OF MACHINE SHOP—M. BEATTY & SONS.

Machine Shop.

The machine shop is a substantial reinforced concrete building 160 ft. by 90 ft. It is divided into two bays, the main bay being 50 ft., wide and the side or west bay 40 ft. wide. Steel columns carry the crane tracks over the main bay, the distance from floor to the crane rails being 20 ft. The "Niles" crane is operated by 220 volt D.C. motors, and has a capacity of 15 tons with a span of 50 ft. A standard gauge track runs the full length of the main bay and connects with another track entering the shop at the end, from the west side and connecting with the boiler shop.

The west bay is 40 ft. wide and has a clear height of about 18 ft. At the north end are the tool stores and wash room, the rest of the floor space being utilized as a machine shop where are installed the lighter machine tools with a bench for fitters along the wall. The tools for the heavier work are installed in the main bay, in the centre of which the hoisting engines are assembled. The hoisting engines are made either with or without boilers to suit customers' requirements. There are a number of jib cranes installed throughout the machine shop, all equipped with Yale & Towne chain blocks.

The machine shop is well equipped with a number of modern machine tools designed to use high speed steel. The principal tools include a 100-inch vertical boring mill supplied by John Bertram & Sons Co., Dundas, Ont.; a 42-inch engine lathe by the London Machine Tool Co., London, Ont.; a 48-inch x 20-ft. Bertram planer; a 72-inch Bertram radial drill and a 42-inch radial drill

BIRD'S-EYE VIEW OF PLANT—M. BEATTY & SONS.

by the Cincinnati Bickford Tool Co., Cincinnati, Ohio. These machines all have individual motor drives, while the smaller tools are driven from the main line shaft which in turn is driven by a 40-h.p. Canadian Westinghouse 220-volt a.c. motor. The smaller tools include principally 24-inch and 28-inch engine lathes supplied by the Gisholt Machine Co., Madison, Wis.; No. 4 and No. 5 "Cincinnati" milling machines; a 20-inch shaper by the same company—the Cincinnati Milling Machine Co.; a Bertram 72-inch horizontal boring mill and a 22-inch Lodge & Shipley lathe.

Foundry and Core Room.

Adjoining the south end of the machine shop is a building 53 ft. long by 90 ft. wide with a standard gauge track running down the centre and connecting with the machine shop. On the east side is a general store room and on the west side is the cleaning room.

On the south side, and a continuation of the same building is the foundry and core room. The foundry is 100 ft. long and 60 ft. wide, while the core room on the west side is 80 ft. long by 30 ft., wide. The cupola room at the north end of the core room is 20 ft. x 35 ft. In the foundry are two 10-ton electrically operated "Niles" cranes with a span of 60 ft., and operating over the full length of the building. There are two ovens in the core room, each 15 ft. wide, by 30 ft. deep. They are equipped with "Kinnear" rolling doors and are heated with natural gas. There is an overhead runway in connection with each oven, equipped with 1-ton Yale & Towne chain blocks. Adjoining the core room is a 36-inch "Whiting" cupola, and the charging floor is served by a "Beatty" electric hoist and conveyor.

The pattern shop is situated near and on the east side of the foundry. It is 90 ft. long by 50 ft. wide. This shop, like the others, is of reinforced concrete construction and has a floor above, which is used as a lumber storage. The equipment includes an overhead hand-operated travelling crane equipped with a 2-ton Yale & Towne Triplex block: a 12-inch buzz planer; a 26-inch surface planer; a 36-inch band saw; rip saw, etc. A number of these machines were supplied by the Canada Machinery Corporation, Galt.

Power Plant.

Power rates being comparatively low, the company use outside power entirely which is obtained from the Cataract Power Co. The current is stepped down from 2,200 volts to 220 volts by three 200 K.W. Canadian Westinghouse transformers located in the transformer house adjoining the power house. The power house contains the air compressors and a Canadian Westinghouse motor generator set which supplies D.C. current at 220 volts to the crane motors. This is an 85 K.W., 3-phase machine running at 766 R.P.M. The switchboard was supplied by the Canadian Westinghouse Co., and has 3 panels equipped with an ammeter, 2 voltmeters, 2 oil circuit breakers, an integrating watt meter and switches.

A considerable amount of compressed air is used throughout the plant, and for taking care of this service, three Canadian Rand air compressors have been installed. The largest of these machines is a cross compound compressor with air cylinders, 12 in. and 20 in. diameter, by 18 inch stroke. It has a capacity of 1170 cu. ft., of free air per minute against a pressure of 100 pounds at 180 R.P.M., and is driven by a Canadian Westinghouse 200-H.P., 220 volt A.C. motor, running at 625 R.P.M. Another compressor has air cylinders, 9 inch and 14 inch diam., by 12 inch stroke, with a capacity of 320 cu. ft. of free air per minute against a pressure of 100 pounds, and runs at 150 R.P.M. This machine is driven by a 75-H.P., 220-volt, A.C., Canadian Westinghouse motor. The third compressor has air cylinders 8 inch and 12 inch diameter, by 12 inch stroke with a capacity of 250 cu. ft. of free air per minute against a pressure of 100 lbs. at 160 R.P.M., and is driven by a 60-H.P. 220-volt A.C. Canadian Westinghouse motor. The compressors are all of the horizontal cross compound type, the cylinders being fitted with Corliss inlet valves and poppet outlet valves.

Adjoining the power house is the boiler room which contains a 100-H.P. Robb Mumford horizontal return tubular boiler and a Sturtevant duplex 5¼-3½-5 inch boiler feed pump. The boiler provides steam for the ventilating system, heaters, fan engine, and for heating the offices.

Heating and Ventilating.

The ventilating system was supplied by the B. F. Sturtevant Co., Boston, Mass., and is located on the floor above the store room. The system consists of a 10-ft. diameter steel plate fan driven by a 10-H.P. vertical Sturtevant steam engine, and five sections of heating coils supplied with live steam from the boiler. The piping is arranged so that each section is controlled independently of the others in order to obtain a variation in the final temperature in the shops according to the outside temperature. The warm air is carried in galvanized iron ducts to the various shops where it is distributed by branches leading from the main duct. Electric light is installed throughout the shops which are equipped for the most part with 100-c.p. tungsten lamps.

General Features.

Other buildings include a storage, 130 ft. by 35 ft., for hoisting engines. This is located at the south-east section of the plant. A building of similar dimensions is used for a pattern storage. Near the main road is the office building which is two storeys high. On the ground floor are the private and general offices, while the drawing office is on the floor above.

TENSION ON CYLINDER COVER STUDS.

By J. H. Rodgers.

IN the September, 1909, issue of The Power House a question of steam pressure was brought before the readers, and, after having been discussed for three or four months, the matter was shelved. As the topic involves much that is of interest to mechanics, I beg to submit the following for consideration:—

The question as originally stated by Mr. Jones was as follows:—If we had a cylinder cover secured to the cylinder by ten studs, each screwed up to a tension of 1,000 lbs., and if the face of the cover has an area of 100 square inches in contact with the steam, would there be an increased tension on the studs if steam were admitted into the cylinder at 80 lbs. per sq. in.? Mr. Jones thinks there would be no increased tension until the pressure in the cylinder exceeded 100 lbs. per sq. in., and, while I do not agree with him or other readers with a similar theory, I am open to conviction. We are all readers of The Power House to learn and benefit by the articles which appear therein.

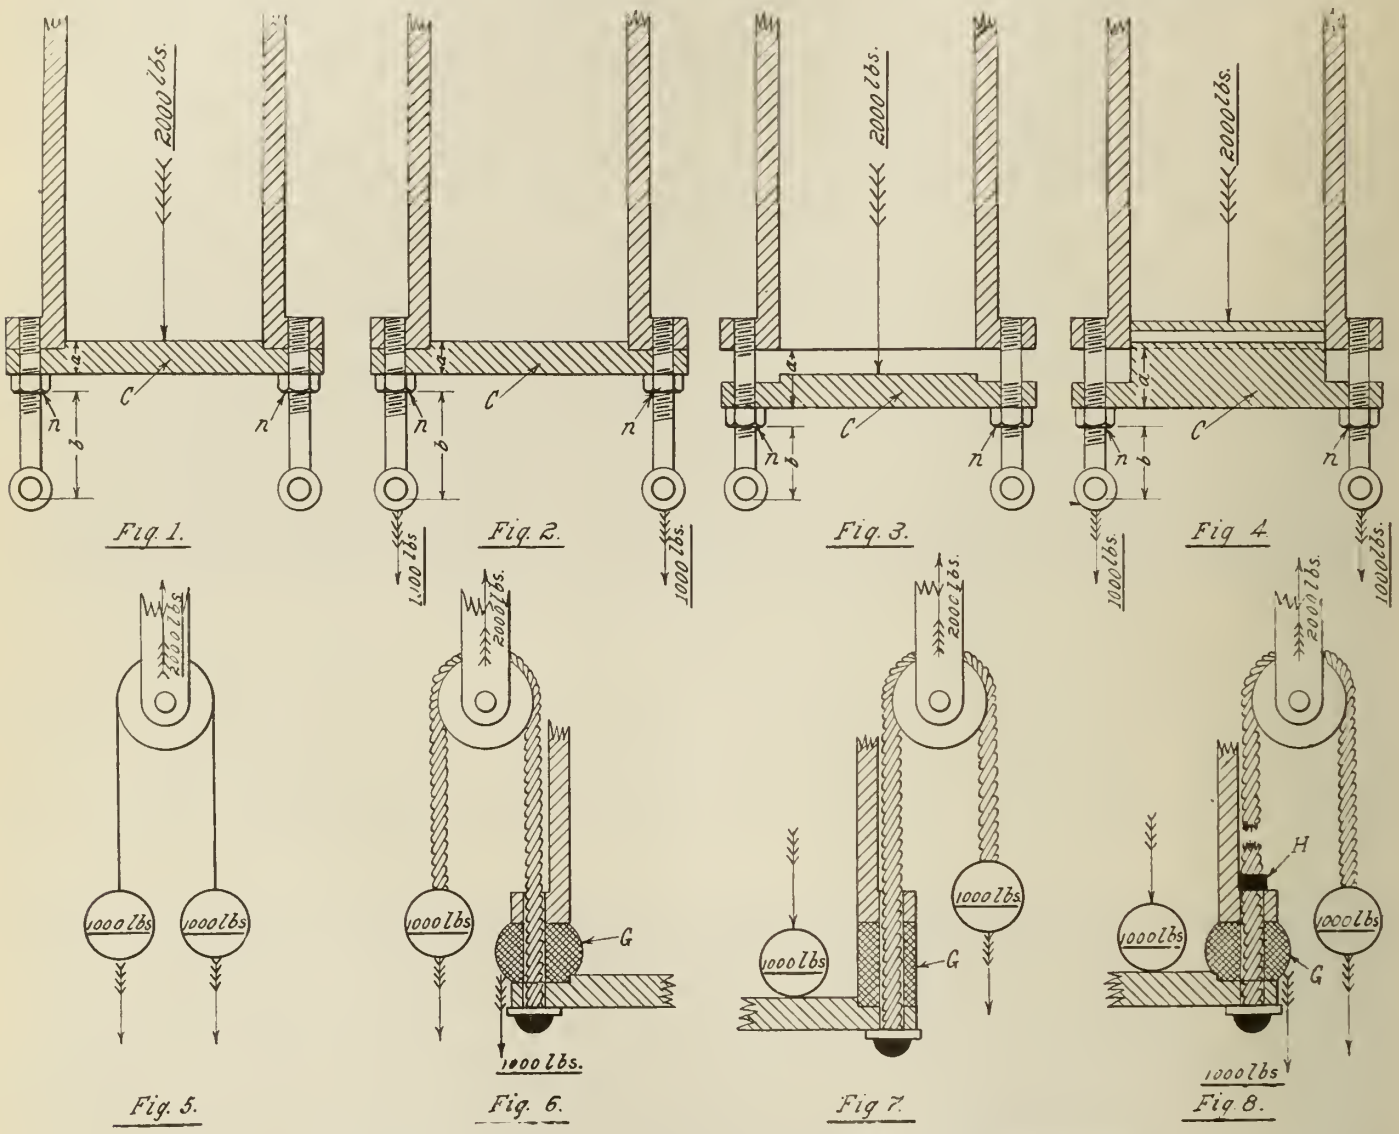
Mr. Orr, in the December, 1909, issue, believed that the tension on the studs does increase. He brought before us another question, an offspring of the original, which I believe has not yet been discussed through these pages: "Does the pressure of the steam against the inside of a cylinder cover lessen the screwing-up pressure with which the studs hold the cover against the cylinder end?"

The Writer's Theory.

The accompanying sketch will, I hope, bring to the readers my theory of the above two questions, and for convenience of illustration, only two studs are dealt with, the ultimate total result being obtained by multiplication. In the figures a cover and section of cylinder are shown. Fig. 3 has the stud nuts (n) screwed up against the cover by hand, leaving no tension on the stud except the weight of the cover, which in this instance need not be considered.

If a weight or pressure of 1,000 lbs. per stud, or 2,000 lbs. for two studs, acts on the inside face of the cover, the portion (a) of the stud is under a tension of 1,000 lbs., but the portion (b) is under no tension. Now, remove the 2,000 lbs. weight or pressure and tighten the nuts

(n), so that there is a tension of 1,000 lbs. on each stud between the nut and the cylinder end; then hang a weight of 1,000 lbs. on each stud, as shown in Fig. 2. Previous to the weight being applied, there was no tension at (b), but now there is 1,000 lbs. at both (a) and (b), which leaves the nut (n) free to move, also the cover.



Again, if the weights are removed from the eyes of the studs and placed on the cover, as in Fig. 1, there should be 4,000 lbs. tension on the two studs at (a), that is, 1,000 lbs. due to the pressure of each nut and 2,000 lbs. on the cover. This is more clearly shown in Fig. 4, for, while the tension on each stud at (b) is only 1,000 lbs., at (a) the tension is 1,000+half the weight on the cover, or 2,000 lbs. If the weight on the cover were only 10 lbs., the portion (a) of each stud would have a tension of 1,000+half the weight on cover, or 1,005 lbs. In the above four illustrations the compression of the gasket and flanges are not considered. Fig. 5 shows a simple pulley supporting two weights, so that while the pulley, bracket and pin are supporting 2,000 lbs., the rope is only under a tension of 1,000 lbs.

In Fig. 6, one of the weights is removed and the rope secured to a washer below the cylinder cover, the gasket (G), enlarged to show the action of compression and extension, being placed between the cover and the cylinder end. The gasket under compression exerts a pressure tending to force the cover away from the cylinder, but is prevented by the tension in the rope or bolt. Now, if a weight equal to the tension in the rope be placed upon the cover, as in Fig. 7, the pressure of the gasket due to compression would force the cover away from the cylinder until the gasket (G) was free, but the rope retains a tension of 1,000 lbs.

Suppose we only place a weight or pressure of 100 lbs. on the cover, the compression of the gasket will be reduced one-tenth, and the pressure due to compression will only be 900 lbs. If the rope, as in Fig. 8, be secured as at (H), while the gasket is in compression, and the rope cut, or replaced by a bolt, the gasket would still exert a force of 1,000 lbs. Now, place the weight or pressure on the cover, and the tension on the rope or bolt will be 2,000 lbs. If a weight of only 15 lbs. be placed on the cover, the tension will be 1,015 lbs. This is what I understand from Newton's Third Law of Motion:—"To every action there is always opposed an equal and contrary reaction."

If the tension of the bolt exerts a force to keep the cover against the cylinder, then the compression of the cover, gasket and cylinder end exert a like force to separate the head and the nut of the bolt, or the nut and opposite end of the stud; therefore, any additional pressure on the cover from the inside must be counteracted by an equal force, and if the studs do not take this extra pressure, what does?

I am not positive that the foregoing reasoning is correct, and I hope that some readers will kindly describe and illustrate their theories, and have them published for the benefit of mechanics at large, as the question seems to be of considerable interest to a wide circle of readers.

TENSION ON CYLINDER COVER STUDS—DIAGRAMMATIC REPRESENTATION.

The World's Shipbuilding and Marine Engineering in 1913

The extraordinary development and progress here recorded in the twin spheres of shipbuilding and marine engineering over a world-wide area are to say the least, remarkable, and to us who are citizens of the Dominion of Canada, there is borne home forcibly the insignificance of the contribution made, also the material loss through the indifference displayed towards the propagation of these and their co-related industries.

THE British Empire and particularly that section of it so familiarly dubbed "The Old Country," still maintains its place and prominence in the realm of shipbuilding and marine engineering. It is only natural, therefore, that such data and statistics as are available concerning the "Motherland," her colonies and dependencies, relative to the foregoing industries should be given their rightful setting. It should be noted, however, that development and achievement, and even record, are not being monopolized by Great Britain, but that strenuous and sustained effort in these directions by other countries is becoming each year more apparent. We in Canada have not yet become sufficiently enthused with, nor do we yet realize the importance to our commercial and industrial standing among the civilized and progressive nations of the world what due regard to the establishment and nurture of shipbuilding, and marine engineering would accomplish for us. The observations, data and illustrations which follow, and which have been gathered from a variety of authoritative sources, are such as to fill us with pride because of the work of our kinsmen, and to arouse within us the desire, in the early future, to develop along similar lines.

Prosperity the Keynote.

Prosperity is the note which sounds through all the records of the trade of 1913. In practically every branch of industry activity was limited only by the capacity of plant. During the preceding two years the trade conditions were of a highly favorable character, but satisfactory as these were, they were surpassed by those which prevailed throughout the year just closed, and it may be safe to assume that 1913 marks the highest level of prosperity to which the trade of Great Britain has yet attained. It would be ungrateful to quarrel with the result of the year's working, but in certain branches of industry the progress made would have been even greater had it not been, paradoxical as it may seem, checked by its own prosperity. Labor trouble in the sense of actual strikes loomed less large than it did in 1912, but many employers had to contend with a difficulty scarcely less demoralizing than strikes and infinitely more troublesome to remedy—that of broken time.

While the various industrial centres were employed to their full capacity, the measure of activity is not reflected altogether in profits. Consideration has to be given to the increased costs of working, particularly with regard to material, labor, and the higher rates ruling for money employed in the financing of industrial enterprise. Even when allowance is made for these, the net result of the year's work can scarcely be other than gratifying to the great majority of those engaged in commerce and industry. While the year, taken as a whole, was profitable, it was apparent during the latter two months that the crest of the wave of prosperity had been surmounted, and that the demand is less urgent now than it was. The reductions in the price of material which were made recently are probably the best indication of the trend of affairs, but notwithstanding the falling off, the industries of the country are still enjoying a measure of activity which we would be glad to believe could be maintained throughout the present year.

NEW ALLAN LINE STEAMSHIP "ALSATIAN."

In the Shipyards.

Coming to particular trades, it will be noted from the statistics and comments in later pages that the great industry which looks to the Clyde, not only as its birthplace, but as the principal centre of its activity, had a remarkably successful year. The success was more marked on the Clyde than anywhere else, but it was quite apparent in other British districts and in every country which is attempting to encourage shipbuilding in legitimate ways, and where financial conditions did not handicap the industry in its competition for new work. There was never any doubt as to the genuine nature of the many demands for new tonnage, or as to the ability of the shipbuilding and marine engineering firms to supply that demand, and it was not until there came a falling off in the freight market that owners and builders became less active in their negotiations regarding orders for new ships. With that falling off a reduction in the volume of work on hand in the yards was anticipated, but sufficient time has not yet passed to allow freights to affect seriously the activity of the many firms engaged in turning out new ships.

The amount of tonnage on the order books of the builders must have been very much larger a year ago than any single individual was aware of, as although there was a decided and prolonged reduction in the number of orders reported from time to time, there is, even yet, practically no reduction in the amount of tonnage actually on hand. Builders are still engaged in working off orders placed during the fag end of the boom, orders for first-class liners for companies whose requirements do not always depend on the general trade or the freight market, as that term is usually understood, and for warships for home and foreign navies.

Costs of production have, however, never been higher than they are now, and we need not doubt the words of shipbuilders in the least when they say that profits are far lower than they were when far less money was passing through their hands. Many of the Companies which depend on shipbuilding pure and simple paid very small dividends—some of them none at all—even when they had to their credit large records of new work, but those which combine steelmaking and armor plate manufacture with shipbuilding and engineering have made money, and their prosperity has been credited by the unthinking to shipbuilding because they are known best to the public as shipbuilders. This has been one of the misleading features of the industry for some years back.

THE HAMBURG-AMERICA LINER "IMPERATOR."

The Engineering Shops.

In the engineering shops, the problems faced were less economic than mechanical. Marine engineering in particular is passing through a very obvious period of change, and the best authorities will not venture to predict the result. So far, the steam engine, in one form or another, has held its own against all competitors, and those who prophesied its gradual displacement by the internal combustion motor have seen reason to moderate their opinions. For most services, the modern reciprocating steam engine is more economical than the oil engine, so long as oil remains as expensive and as difficult to obtain at all ports as it is at present, while it has been proved that the turbine can be adapted by means of gearing to all services, and that, therefore, the oil engine must displace it, too, before it can be adopted anything like generally.

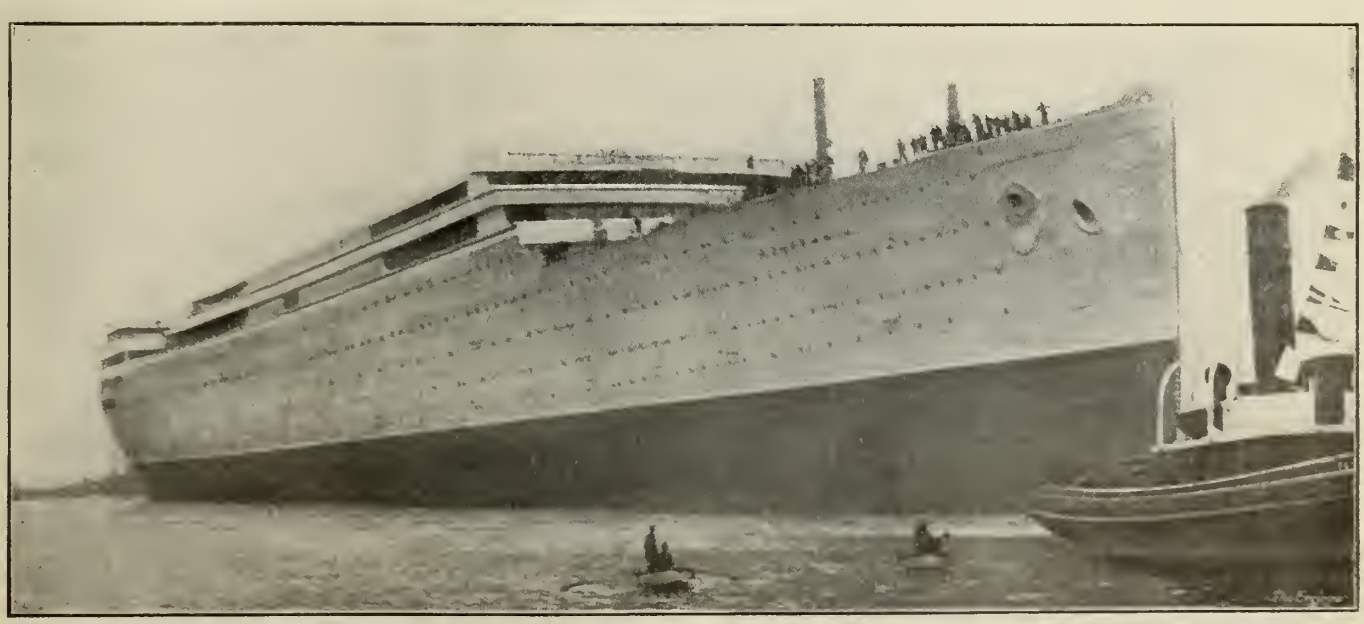
With oil fuel and geared turbines there seems to be still a great future for the steam engine; but engineering progress is so rapid nowadays that no one can tell whether it is to hold the field or be superseded by the direct-driving oil engine or the oil engine driving through electric, hydraulic, or other gearing. Marked progress is being made in all these directions, and in addition the combination of turbines and reciprocating engines is being used with the greatest success in the largest types of Atlantic liners. There has never been a more interesting period in the history of marine engineering than that through which it is now passing, or one of which it was more difficult to predict the ultimate development.

Prospects.

Taken all over, the year may be regarded with satisfaction, but the prospects are far from being so bright as they were twelve months ago. The trade "boom," which has lasted for about three years, is showing marked evidence

of having spent itself, and, while it is impossible to prophesy, there is every prospect of a reaction. For some months manufacturers have experienced a falling off in the demand for their wares, the extent of which is best indicated by the reductions which have taken place in prices.

THE AUXILIARY SAILING SHIP "FRANCE."



The change has been most marked in the steel and iron trades. Steel makers' books have become somewhat depleted, and notwithstanding the lower prices buyers are showing little disposition to book ahead. Pig iron makers also report a falling-off in trade, and many of the furnaces have been put out of blast, makers deeming a restriction of output necessary so long as costs remain so high and no apparent outlet for the iron. Shipbuilders, on the other hand, are well employed, and in some cases cannot undertake to give delivery of tramp tonnage before the autumn of 1914, and bridge builders and constructional works have well filled order books.

While it is true, however, that the trade outlook is not all that might be desired, the prospects for the coming year are not so doleful as they are reported to be in many quarters. Certainly new business is scarce, but in many branches of industry orders already placed will carry manufacturers well into the new year, while the lower level may bring out trade which in 1913 was retarded by the high prices which ruled.

Supremacy of British Shipbuilding.

If there is one lesson more than another which can be learned from the reports of shipbuilding work done in 1913 all over the world, it is that the leading position of Great Britain as a tonnage-producing country remains unchallenged, and—subordinate to this—that the Clyde remains easily the first and greatest of all shipbuilding and marine engineering districts. Despite all the progress which has been made in other lands, despite the obvious fact that other countries are now building as well and sometimes almost as expeditiously as Great Britain, and are endeavoring more and more to supply their own requirements, if not to do a little more, and despite too the admittedly harassing labor conditions which have to be faced in British yards, the country maintains its lead and its shipbuilders continue to provide about their old-time proportion of the total tonnage required for the world's trade.

In 1913 there was no retrogression. The vessels chronicled in the returns show a total in number of 3,936, and in

LAUNCH OF THE CUNARD LINER "AQUITANIA."

measurement of 4,267,166 tons, while there is recorded the remarkable total of 4,924,799 i.h.p. In all of these figures there are increases as compared with 1912—in number of vessels 325, in measurement nearly 500,000 tons, and in machinery over 677,000 i.h.p.

The figures for the United Kingdom make up a very large proportion of the totals, even granting that numbers of small "unmeasured" vessels were built abroad, especially in Holland, of which we have no account, and that our home returns are absolutely complete. In the United Kingdom there were launched 1,474 vessels of 2,263,933 tons, and there were manufactured marine engines of 2,661,260 i.h.p. These figures show increases over those of 1912 of 120 vessels, 183,762 tons and 388,994 i.h.p. Of these increases, the credit for the additional number of vessels is due wholly to England, and that for the increased tonnage and horse-power principally to Scotland. England produced 133 vessels, 95,071 tons and 135,460 i.h.p. more than in 1912, while Scotland produced 15 fewer vessels, but 121,523 tons and 233,485 i.h.p. more, while Ireland turned out 2 vessels more, 32,832 tons less and 20,050 i.h.p. more than in the previous year.

Comparing the work of the United Kingdom with that of other nations—leaving British Dominions out of the reckoning, as not being "foreign" countries—we find that the United Kingdom produced just about one-third of the total number of vessels, nearly 320,000 tons measurement more than all other countries combined, and nearly 420,000 horse-power more. The apparent discrepancy in the lower number of vessels is explained of course by the fact that the vessels built in the United Kingdom are of much greater average size than those built abroad, and even allowing for whatever foreign work may be unrecorded, the margin of tonnage and horse-power in favor of the United Kingdom is so large that the supremacy of British shipbuilding is unquestionable. The following table puts the shipbuilding work of the world for the years 1913 and 1912 in the shortest possible space:

	1913.			1912.		
	Vessels.	Tons.	I.H.P.	Vessels.	Tons.	I.H.P.
England	945	1,322,306	1,399,445	812	1,227,235	1,263,986
Scotland	505	809,711	1,148,225	520	688,188	914,740
Ireland	24	131,916	113,590	22	164,748	93,540
U.K. totals	1474	2,263,933,	2,661,260	1364	2,080,171	2,272,266
Dominions	280	59,025	20,662	208	36,578	17,922
Foreign	2182	1,944,158	2,242,877	2049	1,648,310	1,957,606
Grand totals	3936	4,267,116	4,924,799	3611	3,765,059	4,247,794

Leading Builders.

The old, old trouble about tonnage measurement renders it more than usually difficult to "place" the leading firms for 1913. On the strength of their "with erections" measurement of 107,636 tons, Messrs. Swan, Hunter and Wigham Richardson would be an easy first, but when the work of all the firms is reckoned by Board of Trade tonnages for merchant ships and displacement for warships, it is found that the highest total for the year is to the credit of another Tyne firm—Armstrong, Whitworth & Co. It is all a question of methods of measurement of course, and the Elswick concern have the highest total, principally because they launched two battleships, the tonnage of which is displacement, while the big yards at Wallsend and Walker have the displacement of only two destroyers, and the measurement of one caisson, apart from their Board of Trade tonnage. On the basis of official measurements, then, the order of the first half dozen firms in the matter of tonnage is as follows:—

	Vessels.	Tons.
Armstrong, Whitworth & Co.	9	99,333
Swan, Hunter & Wigham Richardson	22	97,335
Blohm & Voss	8	96,850
William Gray & Co.	18	85,298
The Vulcan Co.	14	85,213
Workman, Clark & Co.	11	84,217

The following are the firms which have had the largest tonnages in the world since 1900:—

Year.	Company.	Tons.
1913..	Armstrong, Whitworth & Co.	99,333
1912..	Swan, Hunter & Wigham Richardson	121,281
1911..	Harland & Wolff	118,209
1910..	Harland & Wolff	115,861
1909..	Workman, Clark & Co.	88,952
1908..	Harland & Wolff	106,528
1907..	American Co. (7 yards)	191,602
1907..	William Doxford & Sons	91,254
1906..	American Co. (6 yards)	193,535
1906..	Swan, Hunter & Wigham Richardson	117,943
1905..	American Co. (7 yards)	136,793
1905..	William Doxford & Sons	86,632
1904..	Russell & Co.	73,689
1903..	American Co. (7 yards)	166,288
1903..	Harland & Wolff	110,463
1902..	American Co. (7 yards)	132,197
1902..	Harland & Wolff	79,497
1901..	Harland & Wolff	92,310
1900..	William Gray & Co.	74,191

The "vessels of the year" were undoubtedly the huge Hamburg-Amerika liner Vaterland, built at Hamburg, and the almost equally huge Cunard liner Aquitania, built at Clydebank. The Vaterland is of 56,000 tons, and is a few thousand tons larger than her sister ship The Imperator, so that she is the largest vessel in the world. The Aquitania—of 47,000 tons—is the largest owned in Great Britain, and the next largest in the world after the two German boats. After the Aquitania there comes the 35,000-ton Norddeutscher Lloyd liner Columbus, built at Danzig, and after this vessel the Hamburg-Amerika liner Tirpitz, of 21,000 tons, built at Stettin. The Clyde-built Allan liners Alsatian and Calgarian—each of 18,500 tons—make the fifth item in the group, and the Hamburg-Amerika liner Cap Trafalgar, of 18,000 tons, built at Hamburg, completes the half dozen—seven vessels really of course. It may be added that although the Vulcan Company have themselves returned the Cap Trafalgar as of 18,000 tons, she has since then been officially referred to as of 18,700 tons, so that it is possible that she should be reckoned as larger than the twin Allan liners. In that case four of the largest half dozen vessels launched in 1913 will have been German built.

Vessel and Type.	Builders.	Tons.
Vaterland—4 screw turbine	Blohm & Voss	56,000
Aquitania—4 screw turbine	John Brown & Co.	47,000
Columbus—twin screw	F. Schichau	35,000
Tirpitz—twin screw turbine	The Vulcan Co.	21,600
Alsatian—4 screw turbine	Wm. Beardmore & Co.	18,500
Calgarian—4 screw turbine	The Fairfield Co.	18,500
Cap Trafalgar—3 screw, recipro. and turbine	The Vulcan Co.	18,000

Leading Engineers.

A very large proportion of the total of 1,111,440 i.h.p. produced by Clyde engineers came from the works of two firms—John Brown & Co., of Clydebank, and the Fairfield Shipbuilding & Engineering Co., of Glasgow. Together, these firms manufactured marine engines—mostly turbines—of 451,200 i.h.p.—more than a third of that of the whole river. The Clydebank work makes a total not only the highest in the world this year but the highest ever produced by one firm, and it, like that of the Fairfield Co., and that of Schichau, of Danzig and Elbing, represents very largely machinery for war vessels. In 1912 John Brown & Co., had the highest horse-power in the world, and the Danzig firm the second highest. The following is the order of the first half dozen engineering Companies:—

	I.H.P.
John Brown & Co.	239,000
F. Schichau	212,800
The Fairfield Co.	202,300
Blohm & Voss	161,000
The Wallsend Slipway Co.	159,550
The Danubius Co.	152,000

R. Garrett, of Montreal, general manager of the International Engineering Co., Amherst, has returned from Liverpool, England, where he has been spending a holiday at his home.

HOW TO PULL A TIGHT KEY.

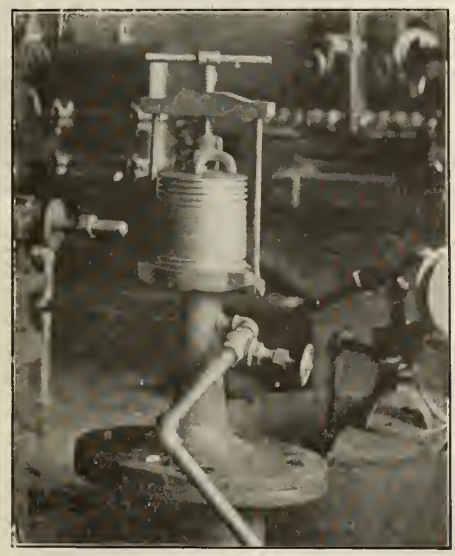
By N. G. Near.

THERE is shown herewith a little scheme that I have found useful for pulling tight keys. The drawing makes the operation self-evident. The metal block is thicker than necessary in order to show the method more clearly. It is,

HOW TO PULL A TIGHT KEY.

in fact, better to use a thinner block thus making the overturning movement less. Of course the exact arrangement illustrated need not always be strictly followed, there being a hundred and one variations based on the same principle.

PLANING UP GAS ENGINE CAMS.



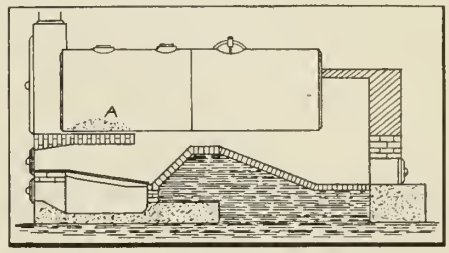
By A. E. Granville.

A GAS engine shop in Elyria, Ohio, planes up their cams as shown in the accompanying cut. The cams are first bored out and keyseated, after which they are clamped on a keyed mandrel. This mandrel is then placed between centres on a planer. The first cam on the mandrel is a hardened master cam, and the operator manipulates his tool so as to cut the others according to the outline of the master cam, as he turns the mandrel by means of the worm and worm gear at the right. Very satisfactory results are obtained in this way on large cams, without the expense of a special machine.

TESTING PISTONS.

By A. E. G.

A METHOD of testing automobile pistons, in use in the Royal Tourist factory, is here shown. The piston is



TESTING PISTONS UNDER WATER PRESSURE.

placed on the stand, open end down, the yoke is swung up over it, and the screw clamp tightened. Next, water under high pressure is turned into the inside of the piston from the pipe in the foreground. In this way, any leaks that might develop through flaws in the casting may be easily detected by the water oozing through to the outside.

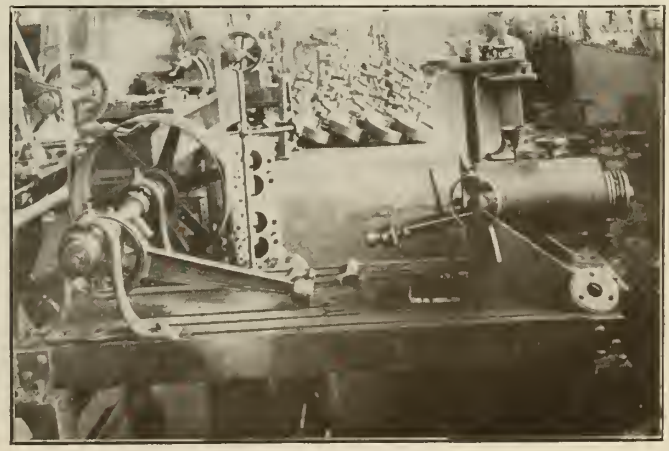
PROTECTIVE ARCH.

By C. Fenwick.

THE accompanying drawing shows an improved setting for return tubular boilers. The arch over the fire serves the double purpose of improving combus-

PROTECTIVE ARCH.

tion and preventing the burning of the boiler. In nearly every case, mud and loose scale will lodge as shown at (A) in the drawing, and where very dirty water is used the arch will be a great help.



GRINDING-IN PISTON RINGS.

By A. E. G.

AN unusual method of grinding-in piston rings, after they are split, in order to make them perfectly round, is practised in the Nordyke & Marmon shop. The piston rings are placed on a special piston and run in a cast iron cylinder as shown in the illustration. The piston is operated by a belt-driven

PLANING-UP GAS ENGINE CAMS.

GRINDING-IN PISTON RINGS.

eccentric, the rod of which is connected to the piston rod by a ball and socket joint, so that the piston may be revolved during the lapping operation. Powdered glass and oil are poured into the cylinder through a small funnel in the top. The rings come from this operation with a beautiful finish, and so round that they fit the automobile cylinders perfectly. The reason for using powdered glass is that it does not imbed in the iron as does emery.

A NEGLECTED SAFETY DEVICE.

By J. H. W.

IN spite of all that employers may do towards instilling the "Safety First" idea into the minds of their employees, and in spite of all the safety appliances with which they may equip their machinery, men will still be found who seem to take a pleasure in tempting Fate. The accompanying illustrations show how a serious accident occurred in the planing mill at the Turcot works of the Canada Car and Foundry Co. An employee, while operating a tenoning or gaining machine, held the piece of lumber on which he was working with his hand, instead of using the presser bar and post attached to the machine for the express purpose of preventing accidents. After gaining the piece, he pushed the material over to the coping head, with the result that the latter pulled the piece of lumber from the operator's hands, and at the same time forced the gauge out of position. The consequence was that the man's left hand was drawn under the gaining head, resulting in the partial severance of four fingers.

This accident was caused entirely by the gross neglect of the victim, who failed to use the safety appliances provided.

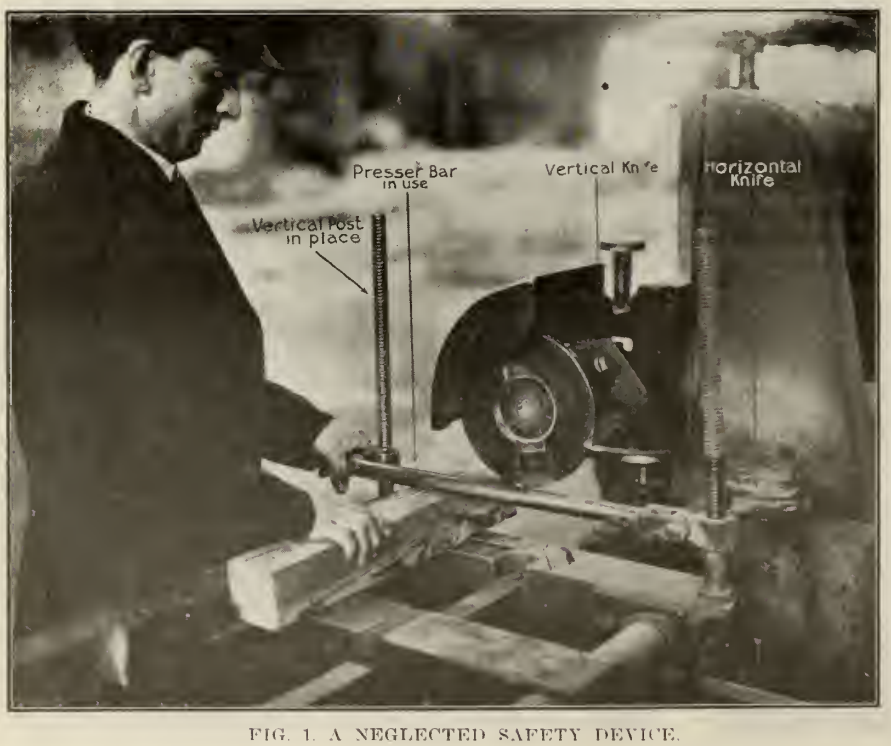


FIG. 1. A NEGLECTED SAFETY DEVICE.

Fig 1 shows how the operation should be performed. The operator's hands are seen to be entirely out of danger while he pushes forward the table on which the lumber is held down by the presser bar. How the accident happened is clearly shown by Fig. 2. The operator is here seen gripping the piece of wood with both hands instead of using the presser bar. The horizontal knives have thrown the work back on the vertical knife, and the operator's left hand is being drawn under. The presser bar is lying idle at the back of the table, and the front vertical post has been removed.

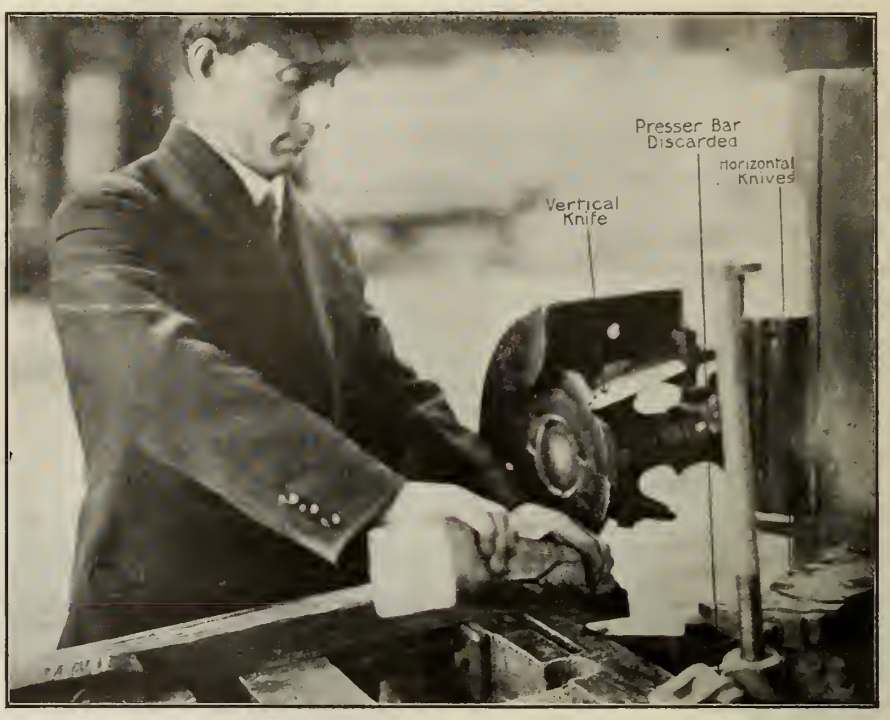

FIG. 2. A NEGLECTED SAFETY DEVICE.

These illustrations are published by courtesy of the Canadian Car and Foundry Co., Ltd.

BLUING IRON AND STEEL PRODUCTS.

By A. V. Francis.

WHILE the subject of bluing iron and steel products is an old one, there are probably many mechanics who envy the necessary knowledge of details to ensure such excellent bluing jobs as those commonly found on revolver and gun barrels. The following method is in vogue in most of the gun shops, and may be of interest to those not already familiar with the details of the process:

The apparatus required consists of a rectangular cast iron tank of suitable dimensions. This is made round at all corners to diminish the liability of its cracking by expansion or contraction, and is permanently set over a furnace. The tanks in use are usually of sufficient size to hold 20 pounds of black oxide of manganese, with 180 pounds of potassium (200 pounds of the mixture in the proportion of 1 to 9). The fire being built in the furnace underneath the tank, the saltpetre melts and the manganese settles on the bottom like thick mud. When the workman is ready to com-

mence operations, he stirs up the manganese, and then ascertains whether the bath is of the right temperature by throwing upon it a sprinkling of dry sawdust. If conditions are right, the sawdust will instantly sparkle and ignite, but if the bath is not quite hot enough, the sawdust will glow for some time before taking fire.

Having brought the bath to the proper temperature, the work, which must be absolutely dry, is immersed in it and allowed to remain until heated to the same degree. If tempered work, it is plunged as soon as taken from the heated bath for a few seconds into cold water to set the temper. If the work be not tempered this plunge is omitted. It is then dipped into boiling hot water for a moment, and then immersed in a bath of oil. When removed from the oil, it is allowed to drain, being subsequently wiped off. It will then be found to be of a beautiful dark blue color, of a depth and permanence greater than that obtainable by most other known methods. Either iron or steel can be blued in this way. Great caution must, however, be exercised to prevent the nitre from coming in contact with the fire on account of its expansive and explosive nature. The tanks are replaced as soon as any signs of cracking appear.

In order to produce the best results, it is necessary that the surface shall be made thoroughly clean, for if a piece of highly-polished steel is simply touched with the uncovered hand, there will be an impression left upon it which will show after it is blued unless the imperceptible stain is removed before the heat is applied.

Variety Coloring.

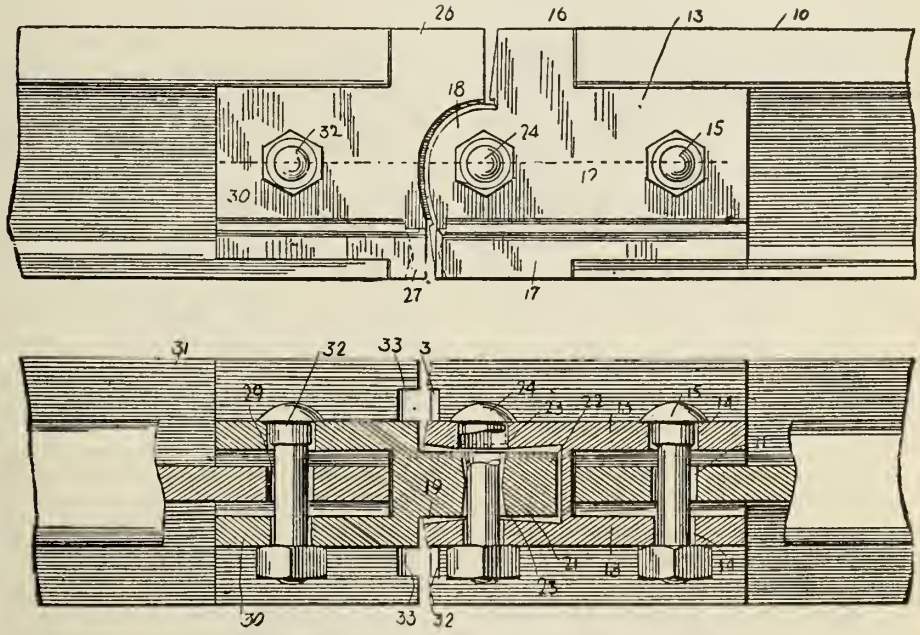
A variety of colors on iron and steel can be produced by means of a mixture of lead acetate and sodium thiosulphate. The following proportions may be used, with the results enumerated below, the colors altering with the time of immersion:—Lead acetate, 50 grains; sodium thiosulphate, 50 grains; water, 5 fluid ounces. The solution must be used hot.

1, Light brown color; 2, darker brown color; 3, purple and blue mixed; 4, purple and blue paler tone; 5, uniform bright blue color; 6, steel grey; 7, black color after a half-hour immersion.

Another way is to dissolve in four parts of water, two parts crystallized chloride of antimony, and one part gallic acid, and apply the solution with a sponge or cloth to the article. Repeat any number of times until the desired depth of color is obtained. Wash with water, then dry, and finally rub articles over with linseed oil. The metal thus receives a brown tint and resists moisture.

IMPROVED RAIL-JOINT.

SEVERAL steamshovels in the service of the Panama Canal Commission are operating on portable tracks equipped with a rail-joint designed and patented by P. J. Thull, of Culebra, a steamshovel engineer now employed by the Fortifications Division. The joints are manufactured in the shops of the Mechanical Division, and are made of cast steel.



Steamshovel operations require usually that the shovel advance in the progress of excavation over uneven ground of varying firmness. Six-foot lengths of track handled by laborers in the shovel pit are connected ahead of the forward trucks of the machine. Conditions frequently require that these lengths of track deflect in both vertical and lateral planes with the passage of the machine. The ordinary strap joints, using plates 1 inch thick, 2½ inches wide, and 10 inches long, with two 1-16-inch holes punched at either end, provide for slight variation. If connected loosely enough to allow lateral turning, they make the track insecure, and vertical motion is restricted by the flanges of the rails. The provision of curved sections to meet contingencies is inconvenient and expensive. The Thull joint is designed to be used on both horizontal and vertical curvatures, and to provide means for eliminating the horizontal displacement while keeping the vertical displacement.

Referring to the illustration, (10) represents a rail, provided near the extremity with elongated apertures (11), and engaging the end of the rail with its side flanges or cheeks (13) is the female part (12) of the joint. The cheeks are abutting against the top and bottom of the rail and are provided with an aperture (14), registering with the aperture (11) of the rail (10), so that bolt (15) binds the cheeks (13) of the female part of the joint to the rail end, forcing the upper and lower abutments of the cheeks against the head and bottom of the rail flange.

A portion (16) of the female part is offset so as to conform with the head of the rail, abutting against the same and having the same width, and flush at its sides with the cheeks (13). A portion (17) is also offset in a direction opposite to the offset (16), being made to conform with the bottom flange of the rail, abutting against it, and having the same width, and made flush with the lowermost surface.

At the ends opposite the cheeks (13) and substantially central with them, jaws (18) are provided, forming the female portion of the joint, with a recess (19) formed in the body of the female part, and complementing the jaws (18). The jaws (18) have their end surfaces beveled, and the end surfaces of the projections (16) and (17) are similarly beveled. Engaging the female portion (12) by means of a tongue (21) substantially circular in shape is the male part. The tongue fits loosely into the recess (19) of the member (12), and is provided with a projection (22) fitting into the recess (20), with sufficient play at top and bottom.

Orifices (23) and (23′), substantially central with the jaws (18) and central member (21), are provided in both the male and female portions, and a bolt (24) binding these two portions constitutes a centre or pivot for same. The male part is also provided with flanges (30), offset portions (26) and (27) similar to (16) and (17), respectively.

SIDE ELEVATION AND HORIZONTAL SECTION OF THULL RAIL JOINT.

abutting against the head and flange of the rail, and also with orifices registering with orifices (29) in another rail (31). The male part is similarly attached to the rail (31) by means of a bolt (32), as is the case with the female part above described.

The recess (19) formed in the female portion (12) is beveled, so as to converge toward the middle of the sides. The orifice (23') is also beveled from the centre toward the extremities, so that the male portion can be translated horizontally to right or left, according to extent of the bevel provided in the recess (19), and, as above described, the offsets (16) and (17) have their end surfaces beveled for the purpose of allowing the horizontal displacement. By means of this provision in the joint for the horizontal displacement, a curvature can be formed in the joint of a certain degree, and the track may have any zigzag shape desired within the limits of the bevel provided in the joint—that is, in the recess (19) and orifice (23').

The vertical displacement, as can be seen, is obtained by the rotation of the joined parts about the centre, which is the bolt (24), and this displacement is limited in the vertical direction, up and down, by the portion (22) of the male part engaging the recess (20), as above described. When only vertical displacement is desired, and the horizontal is to be prevented, notches (32) and (33) are provided at each side of the facing ends of the bottom of the male and female parts, these notches being beveled from the centre upward and downward, so that a spike may be inserted, preventing side displacement, but allowing rotation about a pivot, there being bevels provided where the spike engages the female and male portions.

With this device, any safe unevenness in the ground should be taken up by the vertical displacement of the joint—that is, by the pivotal connection. Similarly, there should be no necessity for a series of curves, as the safe curvature for a rail will be formed by the articulated joint in the horizontal plane.

A trial set of these joints was manufactured at Gorgona shops, at Mr. Thull's expense, for use on the shovel which he was operating, and upon their appearing satisfactory, the Canal Commission ordered the manufacture of enough to equip ten steamshovels. Each shovel requires twenty-two joints. Under a contract, dated July 28, 1913, the Commission pays Mr. Thull a royalty of 70 cents on each joint manufactured; and in a letter, dated December 30, 1913, the superintendent of construction of the Fourth Division reported to the resident engineer in charge of the division, with reference to the Thull joint, as follows:

"These joints have been in use for several months and are still giving satisfaction. They are much better than the ordinary strap connection under all conditions, but are especially so in cases where shovels are working on a soft bottom or where there is considerable water in the shovel pit. The sections when connected with these joints have almost a continuous rail. The old strap connections make such a loose joint that the wheels of the trucks would often climb the rail when moving up, unless great care was taken. This happened where the sections were down in the mud or covered with water. The Thull joints are also valuable when shovels are working in slides, where it is often necessary to back them out of the pit very suddenly, without sufficient time being available to line the sections up in proper shape."

DRAWINGS FOR PATTERN-MAKERS.

IN many works where short time deliveries of orders are given, said Mr. Thomas Roberts in his recent paper read before the Manchester Association of Engineers, the system prevails of sending to the pattern shop preliminary or temporary plans, so that the pattern-makers can start the order and save time while the plans are being finished. This means that when you think the pattern is almost finished, and the corrected plan comes to hand, you find out you have only just started, for the so-called small alterations of the drawing office turn out to be large and annoying. The alterations make the pattern a very expensive one, and the time supposed to be saved is sometimes more than lost in making alterations, while, in many cases when the pattern is completed, it gives no satisfaction either to the workman, his foreman, or the moulder who has to work off it.

If good cheap patterns are to be made, and that is what all engineering works are asking for, the best way to achieve this object is to give the worker a good clear drawing, with all elevations, plans, and sections of complicated parts shown, so that any ordinary pattern-maker can read them. All tooled parts should be shown by the letter (T) or red-lined, and all internal cores with metal round them ought to have shown on the plan the arrangement for getting out the cores and allowing for the escape of the gases. This might be arranged with the foreman moulder while the drawings are in progress. It very often happens that when this is left to the discretion of the foremen concerned, they will put them, to suit themselves, in a place which is wrong, and then there is trouble in the erecting-shop.

Alterations to Drawings.

Another important point is the alteration of figures on blue prints and standard plans when wanted for new orders. These ought to be made in white or black, not red ink, which has been the cause of a great many pattern-makers' troubles. In all works where they have any respect for standard drawings, the paper tracings and prints are mounted on cloth where intended for shop use. This is a good plan and ought to be generally adopted.

In nearly all factories, old plans and drawings have to be altered to suit new orders, and these alterations ought to have a mark or notification on a special list issued to the shop of parts altered; this prevents alterations being missed, and ensures proper checking of the pattern before sending to the foundry. Those who have to deal with these altered plans will understand the importance of this suggestion.

The chief draughtsman or the draughtsman who has made the drawings of any special work might pay a visit to the pattern room when patterns are finished, and inspect them. The time spent in doing so will not be lost in a great number of instances. In the case of large patterns, the writer has insisted on this being done, and all concerned have felt the benefit of it.

Another point which should not be left to the shop is that where there are unequal thicknesses in parts of castings, the working from thick parts to thin parts by large hollows, brackets, or root corners ought to be shown on plans and carefully thought out. By doing this the drawing office might help the foundry, and save them from having cracks and breakages in the castings caused through unequal contractions. All alterations made on plans whilst the work is in progress should be notified to the foreman concerned, so that care could be taken that none of them are missed.

The writer's opinion formed after an experience of thirty-four years as a foreman pattern-maker in a large works is that if possible a complete set of finished drawings should be sent into the shops with the order for the work to be done. The job would be then done quicker and cheaper than is possible when the drawings are sent in as they are separately finished. There would be less friction between departments, less need for casting hustlers, and less complaints about the time taken up in each department. In orders wanted for quick delivery, the time for each department could be clearly allotted and worked to.

W. K. Stalford has been appointed electrical inspector for Hamilton, at a salary of $1,300.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

THE LARGEST HARBOR CRANES IN THE WORLD.

By C. F. Krumbiegel*

THE immense increase in size that has taken place in war and merchant vessels during the last twenty years has naturally resulted in a corresponding development in shipyard and harbor facilities. It has been found necessary to improve and enlarge harbor equipment that it might be commensurate with the giant dimensions of the latest vessels; and last, but not least, it has been found necessary to provide the most modern and efficient cranes in order to facilitate the building of such vessels and to enable a large tonnage to be handled quickly and with as little labor as possible.

As a proof that engineering science and capital have been fully able to keep pace with modern requirements, a description is here given of two giant cranes, one a land crane and the other of the floating type. These may be considered the latest word in crane building and have been designed and built by the Deutsche Machinenfabrik, A.G., (Demag), Duisburg, Germany.

The Largest Land Crane.

Figures 1 and 2 show the largest land crane in existence to-day. It is a hammer-head crane of 250 tons capacity and was built for Blohm & Voss, Hamburg, in 1913. It is a revolving crane with a working circle of 500 feet diameter, and has a raising jib designed to clear the masts of ships very much larger than the greatest now afloat. In its highest position, the top of the jib is 327 feet above ground level. On the top chord of both jibs there runs a slewing crane with a capacity of 20 tons at 33 feet radius, or 10 tons at 58 feet radius.

The main trolley, which runs within the main jib, is able to lift 250 tons at a radius of 97 feet or 110 tons at 174 feet radius. The lifting speeds are as follows:—

Load.	Speed.
250 tons...about	5 feet per minute.
200 tons...about	6.4 feet per minute.
100 tons...about	13 feet per minute.

The trolley speed with a load of 250 tons is 32 feet per minute, and the jib can revolve through a complete circle in 12 minutes. When the jib is to be raised, the slewing crane is brought to the rear end, and the main trolley is fixed at the point of the jib, these operations only occupying a few minutes. The crane can then be loaded as before.

To give an idea of the enormous dimensions of some of the parts, it may be mentioned that the spindles for raising the jib have a diameter of 18 inches and a length of 69 feet, while the bottom block of the 250-ton hook has a length of 15 feet. The entire drive is electric, the output of all the motors totalling 524 H.P. The operation of the crane, with all its lifting and slewing motions, requires only three men.

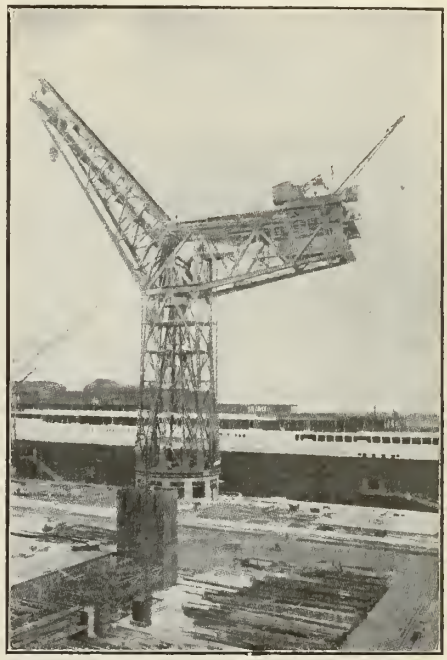


FIG. 2. 250-TON HAMMER-HEAD CRANE WITH JIB RAISED.

The Largest Floating Crane.

As an example of the largest cranes of the floating type, there may be cited the two 250-ton cranes for the Panama Canal, ordered in April, 1913, by the United States Government, and at present under construction in the Demag Works. Each of these cranes will have a raising boom with a working circle of about 240 feet diameter, and their height will be equal to that of an 18-storey building.

The pontoon, which is entirely of steel plate, has a length of 145 feet, a width of 88 feet and a depth of 16 feet, and is well balanced at every position of the load. The four columns of the tower reach through the deck down to the bottom of the pontoon to ensure a very rigid connection of both parts. About three feet above the pontoon deck, and rigidly riveted to the tower, is the supporting ring for the rollers, which are carried by the so-called bell. This bell is supported on the king journal of the main tower by means of a heavy box lattice girder, the lower edge of which is level with the boom hinges.

*Resident Engineer, Gerald Lomer, Ltd., Montreal, Canadian Sales Agents for Demag, Ltd

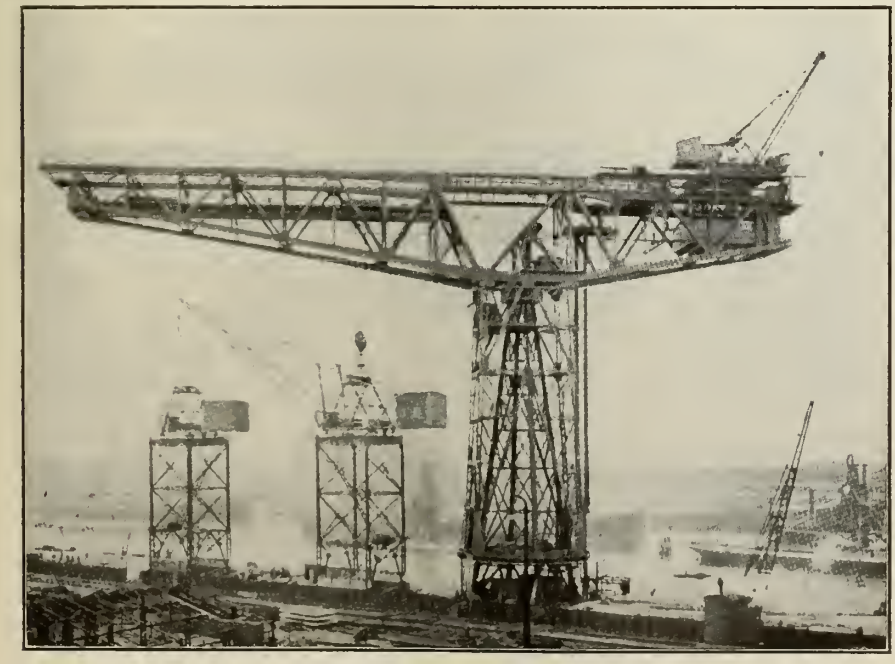

FIG. 1—250-TON HAMMER-HEAD CRANE.

In the forward part of the bell is placed the operators' house, which contains all the apparatus for controlling the crane. There are two main hooks of 125 tons capacity each, which can be connected by a 250-ton loop. Besides this, a climbing hoist of 15 tons capacity is provided for lighter loads. For lifting the heavy sluice gates of the canal, both cranes may be worked together, giving a total capacity of 500 tons.

These cranes are not yet completed, but Fig. 3 shows the type. This illustration has been taken from a somewhat smaller crane, which is shown moving a slewing crane into another position. The large crane in this illustration was supplied to Friedrich Krupp's Germania shipyards at Kiel. It is worthy of note that Demag have built more than 50 per cent. of all existing giant cranes.

As Canadian ports are now being developed to meet the ever increasing traffic requirements, it is hoped that the above description may be of interest to engineers and others. This country is in the fortunate position of being able to equip her harbors from the start with the most up-to-date loading devices, in place of having to make the best of old-fashioned equipment installed many years ago, as older countries may sometimes have to do.

A "BENNIS" COKING STOKER INSTALLATION.

THE accompanying description and illustrations refer to an installation of what is known as the "Bennis" high temperature, smokeless and gritless machine coking stoker at the London Paper Mills, Dartford, England. Coal is transported by means of Bennis U-link chain conveyors, feeding distributing shoots through openings in the bunkers. The plant consists of:

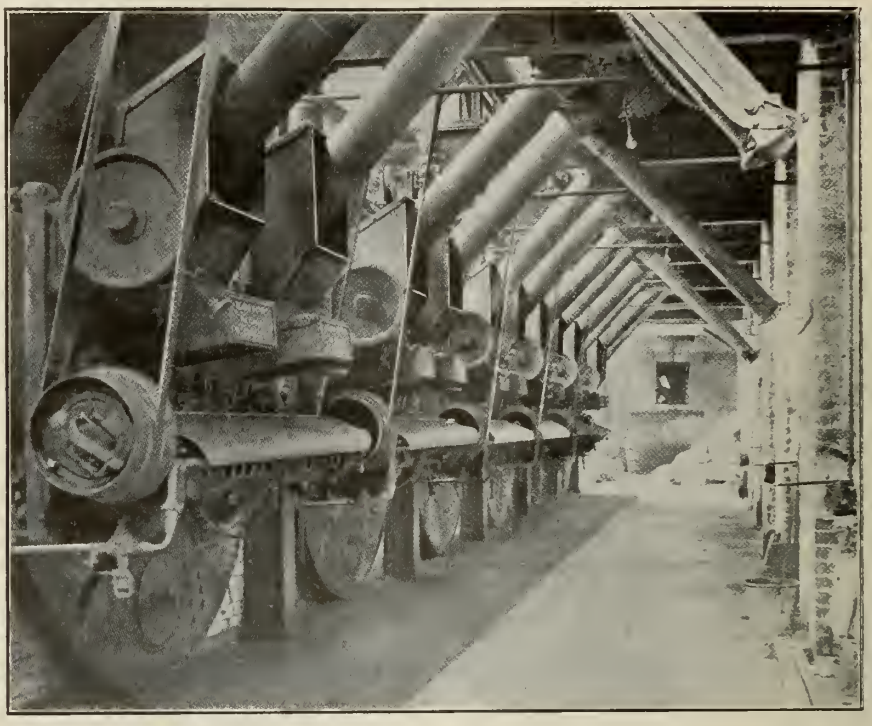

Fig. 1—A range of "Bennis" High Temperature Machine Coking Stokers keeping steam in the Boiler-house of the London Paper Mills.

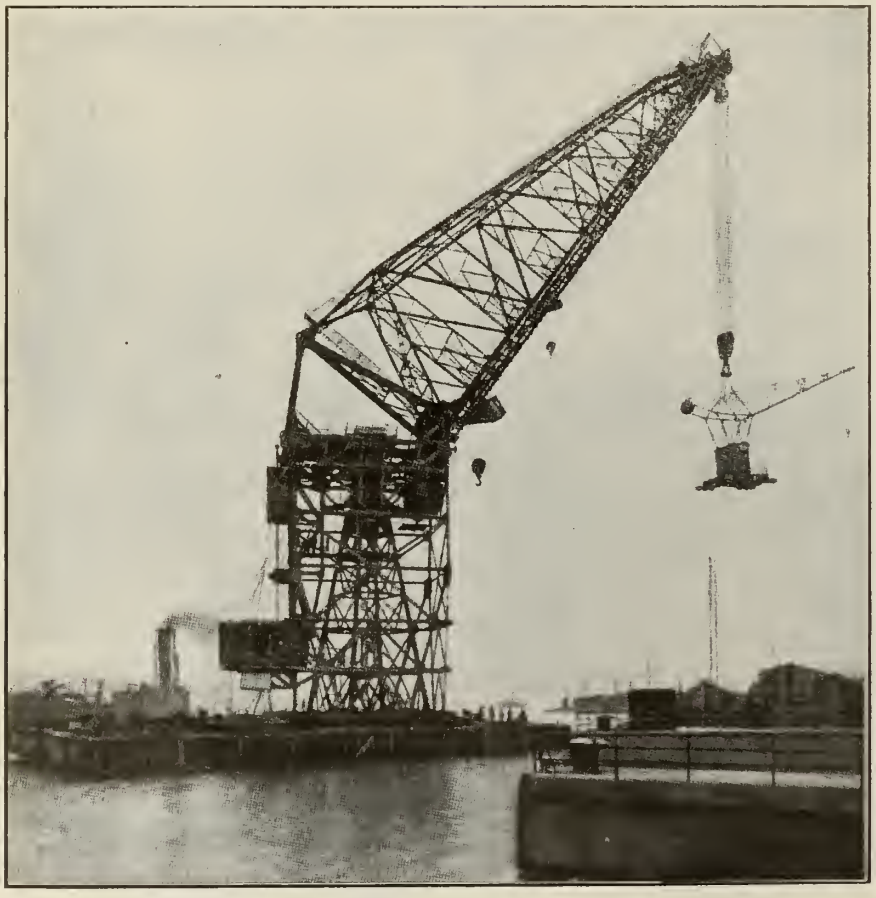

FIG. 3—250-TON FLOATING CRANE, PANAMA CANAL TYPE.

1.—A receiving hopper with supports placed outside the boiler-house on the bank of the river, in such a position that the coal can be deposited into the hopper by a crane and grab.

2.—An overhead coal storage bunker having a capacity of about 330 tons of coal.

3.—Bennis U-link chain conveyors with driving gear, shoots and all supports.

4.—Shoots to carry the fuel from the bunkers to the hoppers of the stokers by which the boilers are fired.

The method of operating the plant is as follows:—The coal is brought up to the wharf in barges. A grab load of coal is raised from the barge by the crane, and dumped into the receiving hopper from which it flows through an outlet into the chain conveyor, which is placed immediately beneath. The first portion of this chain conveyor is carried up an incline and the coal is thus raised to the level of the top of the bunkers. The conveyor then passes horizontally over the top of the bunkers, and the coal is dropped through openings into the storage bunkers beneath. The coal flows by gravity from the storage bunkers into the storage hopper, and a valve is placed at the end of each shoot to control the supply of coal.

The conveyor is of the well-known

Bennis U-link chain type of which this firm has made a specialty during the last twenty years. It has a capacity of 40 tons per hour, and is driven through suitable reduction gear by a separate motor. The overhead coal storage bunkers are built over the firing floor; they are about 80 ft. long by 11 ft. wide, and have a total capacity of about 330 tons. The boiler-house wall is utilized for one side of the bunkers, while the other side consists of a reinforced brickwork wall. The bottoms of the bunkers are hoppered in shape, and are formed out of rolled steel plates with suitable stiffeners and connections.

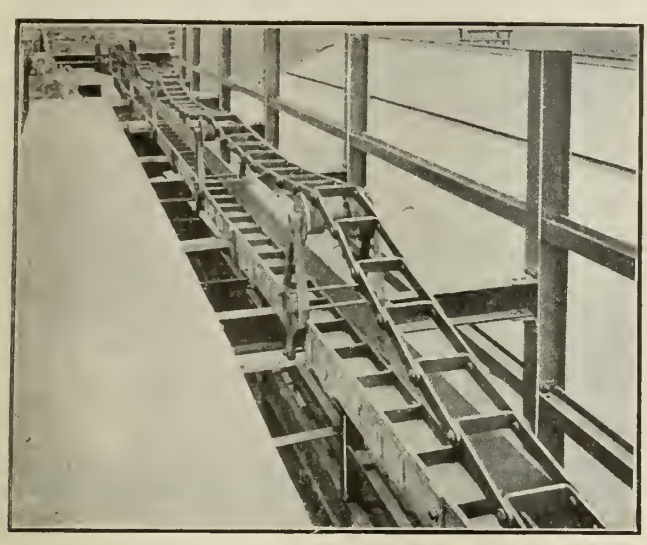

Fig. 2—"Bennis" U-link Chain Conveyor which in part of its travel is inclined to carry the coal to the level of the top of the bunkers. It deposits the contents by means of openings into the storage bunkers beneath, and forms part of the "Bennis" installation of coal handling plant in the boiler-house of the London Paper Mills.

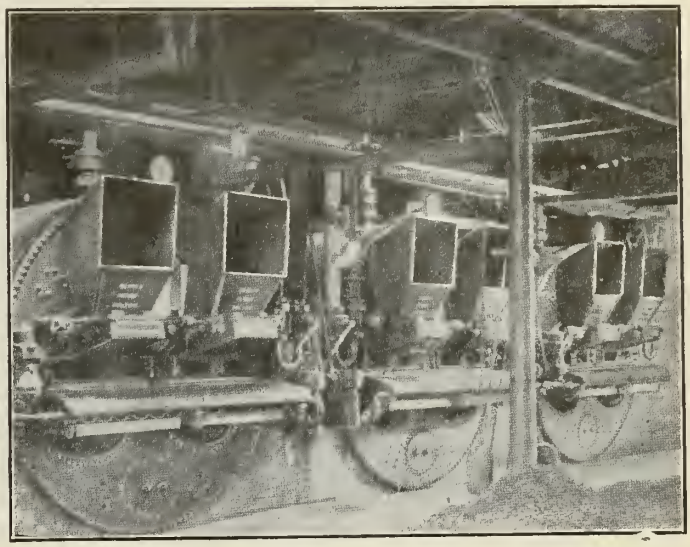

Fig. 3—This range of "Bennis" Smokeless and Gritless Coking Stokers is in operation at the A. E. Reed & Co. Farncombe Paper Mills.

A number of rolled steel joists run the whole length of the bunker to form supports and carry the weight between the stanchions. These longitudinal joists are supported in their turn by other transverse joists spanning the firing floor and carried at one end on substantial stanchions, resting on the floor; the other end being built into the wall of the boiler-house. These stanchions are also used for supporting one side of the main boiler-house roof, and a light roof is built over the top of the bunkers themselves. Access is given to the conveyor chamber over the bunkers by ladders and gangways, arranged so that all running parts are easy of access for inspection and lubrication. The bunker was designed to take full advantage of the existing buildings and to give the required storage without forming any obstruction to the movements of the boiler attendant. It is so arranged that future extensions can be easily affected.

The work of the U-link chain conveyors, as already stated, is to feed the coal to the bunkers which deliver it by means of openings into the distributing shoots which in turn deposit it in the stokers. The illustration, Fig. 1, affords a good view of this range of stokers with the shoots in position and in close connection with the bunkers immediately above.

It is of course essential that steam-raising in paper mills should be absolutely smokeless and gritless, because of the immense harm that can be done to both paper and pulp in various stages of manufacture should grits and smuts be emitted from the chimney and so find their way into the incomplete manufactures.

The Bennis coking stoker for paper and pulp mills has been referred to more than once in these pages, it is, therefore, sufficient here to point to the fact that the installation described was a development due to a satisfactory experience with a similar installation at another of the Paper Co.'s mills.

The following are among a number of the advantages claimed for the Bennis coking stoker.

(1)—The power of rapidly lighting back which carries with it the power of feeding a much larger amount of fuel on to the furnace and getting it burnt.

(2)—A higher and more even furnace temperature than has hitherto been possible with coking stokers. This is induced by the scrubbing of the coke by the air blown into the fire through the very fine air spaces of the compressed air furnace bars.

(3)—Maximum flexibility attained by the power of controlling the air supply to the compressed air furnace bars and the adjustment of the damper of the boiler; a combination adequate to control the rate of combustion.

(4)—Combustion without smoke, grits or dust; the compressed air furnace cleaning into the ash-pit, which is a closed chamber.

(5)—Simple and easy manipulation, there being but two adjustments for the fireman to make, one which determines the rate of feed by turning a nut, and the other which regulates the air-feed by means of a valve.

(6)—Low cost of upkeep, the bars being few and the feed motion simple.

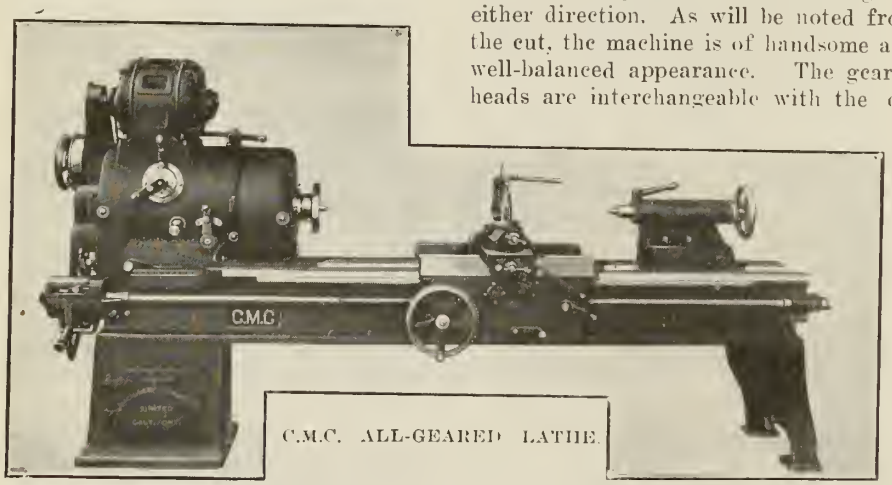
(7)—Stoking bars which keep the fire at a nicely-calculated distance from the boiler front, thereby obviating the hitherto unavoidable injury done to the whole furnace front by parts becoming red-hot.

(8)—Air-cooled fire-doors which prevent damage either to stoker or boiler.

George H. Tod, Manning Chambers, Toronto, is the Canadian representative of the manufacturers, Edward Bennis & Co., Bolton, England.

IMPROVED FILE-HANDLE.

THE illustration shows a patent file-handle, which is manufactured by the W. T. Nicholson & Clipper Co., King Street, Salford, Manchester. As will be seen, the handle is provided with a flanged steel tube, which is pressed into the wood at the end, and into which the file is driven. The flange of the tube overlaps the ferrule, which is formed



IMPROVED FILE HANDLE.

with an internal turnover at the outer end. The tube flange is tapered in order to fit snugly over the ferrule, the whole making a very neat arrangement. The use of the tube prevents any splitting of the wood when the file is driven in, and

also prevents the ferrule from coming off. There is thus no danger of the tang running into a workman's hand. The tube also serves a second purpose by so compressing the wood that the file is held much tighter than in an ordinary handle. This leads to an increased life for the handles, since they are not flattened on the end and destroyed by constant hammering.

C. M. C. ALL-GEARED LATHE.

We illustrate herewith a new all-geared lathe recently designed and put on the market by the Canada Machinery Corporation, Galt, Ont. The cut shows the machine equipped with a direct current constant speed motor, but it may also be arranged for single pulley belt drive. Attention is directed to the head, which is of the totally enclosed, all-geared type, giving eighteen changes of speed from a single motor or pulley drive. This is accomplished by means of two sets of sliding gears and a double jaw clutch. The gears are all of forged steel, hardened where necessary, and with the ends of the teeth properly rounded on a special machine, so that it is no more difficult to obtain any of the eighteen changes than it is to obtain the speed changes on an automobile gear box. The driving pulley for the gear is provided with a friction clutch, so that the load may be released at the moment of changing the gears; and, as the gears are totally enclosed, it has been a simple matter to provide a lubricating system, so that the gears are running in an oil bath at all times and the journals are copiously flooded with oil. The head is

C.M.C. ALL-GEARED LATHE.

so designed that it is impossible to engage two different sets of gears at the same time. The tooth clutches are made of hardened steel. The spindles are of extra high carbon steel, ground to size, and running in bronze bearings, and proper index plates are provided showing the different changes.

The design gives a maximum number of speeds with a minimum number of gears, only thirteen gears being necessary for the eighteen speeds. This results in a minimum number of parts, and the head is free from unnecessary complications. An interesting feature is the means provided for locking the spindle when changing the face plate; a special locking pin being provided, which enters a corresponding hole in the sleeve clutch on the main spindle and keeps the spindle from rotating in either direction. As will be noted from the cut, the machine is of handsome and well-balanced appearance. The geared heads are interchangeable with the ordinary three steps of the double-back geared heads on the other lathe products of the company.

FIG. 1. LARGE TRIPLE-STAGGERED TOOTH STEEL GEAR.

Joseph Patton, of the Dominion Steel Corporation Bessemer Department, has returned from a three weeks' vacation to his home in Washington, D.C.

STAGGERED TOOTH STEEL GEAR.

A STEEL gear of unusual design, and probably the largest of its kind ever manufactured, was shipped recently by the Mesta Machine Co., of Pittsburg. The accompanying illustration, Fig. 1, shows this gear in the company's works at West Homestead, Pa. It was made for the Inland Steel Co., of Chicago, and will be used for driving a sheet mill. By the use of this gear and pinion, a single stage speed reduction is obtained from the motor to the mill.

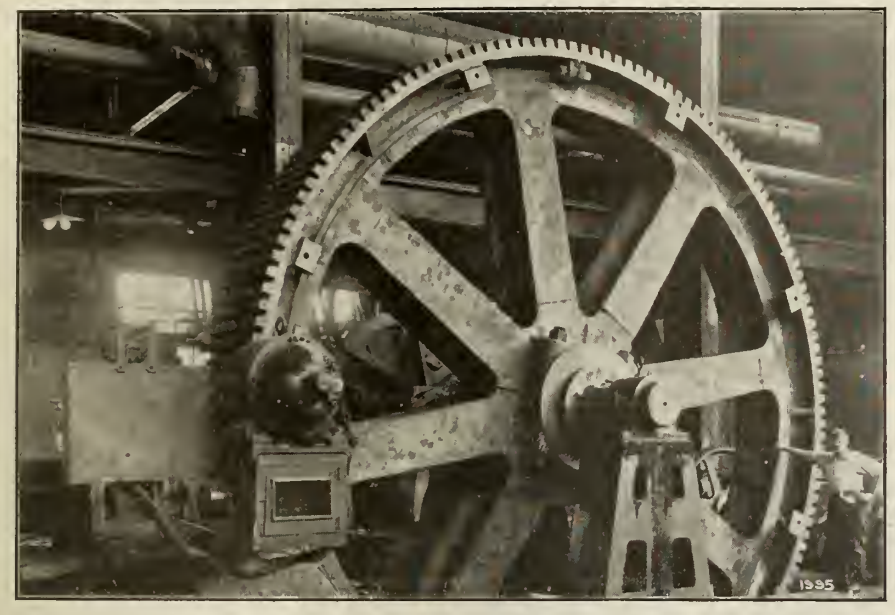
The gear is 22 ft. 8 in. in diameter, 38 in. face, and of 5½ in. circular pitch. The mating pinion is 2 ft. 11 in. in diameter. There are 154 teeth in the gear, and 20 teeth in the pinion. The design varies from ordinary practice because the teeth are staggered in three sections. On account of the axial motion to which the drive is subjected it was necessary to use a spur gear. Herringbone gears were not considered because of the unequal pressures that would be exerted on the side of the tooth face. The gears travel at a speed of 2,000 feet per minute, and to meet the action of this high speed, the teeth are staggered and the drive arranged to run in an oil bath. The machining of the gear will doubtless prove of interest.

All the teeth were cut on a planer designed and built by the Mesta Machine Co., and shown in Fig. 2. In this machine, the tool is driven directly by a heavy lead screw which in turn is operated by a variable speed reversing motor.

The gear itself is built up of six parts. The gear centre, including the arms, etc., carries the central rim segments. The two halves of the gear are bolted together and the separate rims are fastened by bolts running through the side of the central casting.

Starting with the rough casting, the operation of making such a gear is as follows: After annealing the casting, the joints at the hub end rim of the central portion of the gear were planed. These joints were then drilled, reamed, and the two halves bolted together. The wheel was next placed in the pit lathe, the gear centre turned down to the correct diameter and the surface machined where the rim segments were to rest. The main gear was afterwards taken from the lathe and the rim segments machined. Lugs were cast on these segments to aid in holding the work on the face plate. One segment was bolted on the face plate and turned up. It was then reversed, the other side being machined to size, and the segment turned to correct diameter. The surface of the segment to rest on the main gear was also machined at this time. The rims were next bolted securely to the main gear centre with all the teeth in a

line across the face of the gear, as shown in Fig. 2. The teeth were then planed through the centre section and both side sections at the same time. The final cut was taken on the gear without removing the tool during the entire operation of cutting.



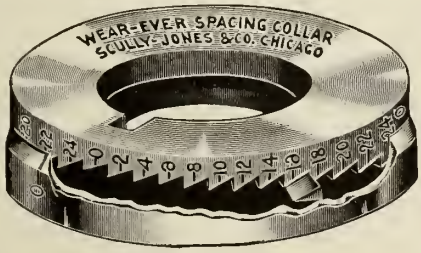


FIG. 2. LARGE TRIPLE-STAGGERED TOOTH STEEL GEAR IN GEAR PLANER, SHOWING METHOD OF CUTTING THREE SECTIONS OF TOOTH AT ONE OPERATION.

The mating pinion was machined in a way similar to that of the large gear. After the teeth were cut, the bolts were taken out and the two side sections shifted on the centre section to give the proper stagger. This was done by using an indicating micrometer, so that the slightest variation from exact dimensions could be eliminated. After the stagger of the teeth of the pinion was set, the teeth of the large gear were set to match the pinion. Holes were then drilled through both rims and the centre of the gear. These holes were reamed and machined bolts inserted. The gear was next taken apart and shipped, and since it is built up of six pieces, together with the fact that the parts were fitted together at the plant with machined bolts, the installation will be quite simple.

"WEAR-EVER" ADJUSTABLE SPACING COLLAR.

THE illustration herewith shows a new form of adjustable spacing collar designed primarily for use in milling machine manufacturing operations, where two or more milling cutters on the same arbor must be spaced exact distances apart. As those familiar with straddle or gang milling machine operations know, it is sometimes necessary to grind the sides of the teeth of the milling cutters. This, of course, changes the distance between the faces of the milling cutters, and, in order to maintain sizes on the piece being manufactured compensation must be made in some way for the amount ground off the cutter. This is sometimes accomplished by carrying in stock an assorted lot of solid spacing collars of varying lengths, and if the exact size cannot be found, provision must be made by grinding off a solid collar that is too long, or shimming up one that is too short, during which time the milling machine is standing idle.

The "Wear-Ever" collar is so designed that thickness may be varied a total of .024 of an inch, and this is divided into twelve spaces of .002 inch each. The adjustment of the collar is quickly made, and, after each adjustment, it is absolutely the same as a solid collar. With the threaded collar sometimes used there are inaccuracies due to the wear of the threads. This collar is now in use in a number of the larger automobile manufacturing plants.

ADJUSTABLE SPACING COLLAR.

Some of the advantages claimed for it over threaded collars are as follows:—

1.—Threaded collars cannot be made less than 1 inch in width. The "Wear-Ever" is ½ inch or less.

2.—Threaded collars after short use become loose and inaccurate in the thread.

3.—Small chips fill the threads necessitating careful cleaning before adjustment can be made, whereas chips cannot interfere with the working of the "Wear-Ever."

4.—First cost of the "Wear-Ever" is low, thus allowing wide use in the machine shop without much investment.

Scully-Jones & Co., Railway Exchange Building, Chicago, are putting this collar on the market.

PRODUCER GAS FROM WOOD.

IN a lecture on "Producer Gas from Wood," recently delivered before the Junior Institution of Engineers, Mr. G. E. Lygo said that gas plant makers had given serious attention to the subject of utilizing wood for use in gas producers. In these plants all kinds of wood, from sawdust to pieces 6-in. diameter, cotton seeds, cocoanut shells, fibre and dust, sugar cane, coffee husks, rice husks, spent tanning bark, rubber leaf waste, surface peat, etc., could, he pointed out, be utilized.

Referring to the design of the plant, the lecturer said many points had to be taken into consideration which were not needed with an anthracite plant. The area of the generator was governed by the nature and size of the fuel, but, roughly speaking, it was 2½ times that required for coal fuel. The depth of the fuel depended upon its size and density. A deep fuel bed was necessary for large pieces of wood, for otherwise air passed through and ignited the gas in the top of the generator. Small dense fuel, such as sawdust and coffee husks, required a comparatively shallow bed, for the resistance of a deep bed would interfere with the working of the engine. The internal hopper must be designed to suit the fuel, some fuels falling evenly in the generator, while others formed a cone in the centre.

Removing Iron Rust.—One of the methods given is as follows:—Steep in a solution of chloride of tin; the time the pieces remain in the bath will be determined by the thickness of the coating of rust. Generally twelve to twenty-four hours suffices. The solution should not contain a great excess of acid. On taking the pieces from the bath, rinse first in water, then in ammonia, and dry quickly. The iron will have the appearance of dull silver, and on polishing will resume its normal appearance.

Robert A. Wilson, formerly of Galt, Ont., has resigned his position with the Ohio Steel Co., Youngstown, O., and accepted a position with the Oil Producer Co., Houston, Texas.

INDUSTRIAL NOTABILITIES--No. 20

ABOUT two years ago, an aggressive young man dropped into Owen Sound, and made the old place live again. While this northern seaport has a live mayor, has a magnificent harbor, and two lively semi-weeklies, yet, somehow, since the C. P. R. boats ceased to call there, and half the hotels in town closed their doors, there has been a sleepy atmosphere about the place that belies the big noise the name suggests.

When Hugo A. Gutenkunst came to town, he had an awakening in store. Every Ontario village loves a new factory, and the veriest Rip Van Winkle of a place will rub its eyes and show signs of life when an American business man comes along and talks of bonuses, free sites, and exemptions, for, nowadays, these words mean new industries.

Owen Sound took Hugo Gutenkunst to her arms, and now, some distance from the railway station, there is one of the most up-to-date malleable iron plants in Canada, with a most aggressive man at the head, keeping it busy with orders from railways and implement manufacturers. The Canadian Malleable Iron Co. plant may one day be to Owen Sound what the Canadian General Electric is to Peterborough.

The president comes from Milwaukee, where he attended grammar and high schools, and took a chemical and mechanical engineering course at the University of Wisconsin. During his younger days, he spent his holidays in his father's factory, so that he was thoroughly

HUGO A. GUTENKUNST.

acquainted with all phases of the foundry business before he left college. He entered his father's plant at the age of twenty. He worked through each department as any other working man would do, and in this manner became acquainted with every phase of the business.

After several years of this training, he was made assistant superintendent, and finally general manager. This position he held for a number of years, during which he designed and built a large new edition.

About this time, Mr. Gutenkunst decided to go into business for himself, and designed and built the Dickson Malleable Iron Co. plant at Milwaukee, Wis., of which company he became vice-president and superintendent. This plant was conceded at the time of its erection to be one of the best laid out and equipped malleable iron factories in the United States.

He sold out his interests in this plant and made a trip through the United States, Europe, and Canada. He decided that there was a large opening in the malleable iron line in Canada. This brought him to Owen Sound, where he built the present fine plant of the Canadian Malleable Iron Co., Ltd.

Mr. Gutenkunst is a member of a number of clubs, both in the United States and Canada, among them being the Deutscher Club, the Milwaukee Athletic Club, Milwaukee Automobile Club, all of Milwaukee, Wis., the Sydenham Club, of Owen Sound, Ont., and the American Club, of Toronto. He is interested in several concerns in the States, and is vice-president of Canada Beds, Limited, Chesley, Ontario.

THE BUSINESS OUTLOOK.

TO all appearance the business depression in Canada struck bottom some time since, if we might judge by the reports of improving tone in the machinery and allied trades. Easier money conditions now prevail, and what is perhaps the most potent feature of all, people generally have become optimists. As remarked on a previous occasion when the descent was still in progress, everybody was lending their weight to accelerate it, and as becomes human nature, all hands are now engaged in the elevating process.

The development and progress of Canada, dependent though it be to a large extent on conditions in other countries must go on, and in this connection there is just the possibility that more of the financial assistance so generally received from Great Britain will this year be forthcoming, if, as is generally believed, the crest of the wave of industrial prosperity there was reached in the closing months of 1913.

THE ATTRIBUTE OF HONESTY.

SOME time ago, a contemporary drew attention to the revelations concerning the New York, New Haven and Hartford, and the Boston and Maine Railroads, and expressed the opinion that, while enforced honesty by means of legislation was not only undesirable, but impossible, there was need of more effective measures than those now in vogue to make the crooked walk straight. Not a day passes, but the business and commercial life of this and every other continent is besmirched through the lack and practice of simple honesty by men in high places. In the humbler walks of life we are more or less prone to expect a considerable display of dishonesty, but just why, in this particular feature, none of us may be able to give a reasonably intelligent answer.

The dishonesty that is rampant in high places is becoming so common and brazen that it passes for smartness, and in a certain sense it earns the latter title so long as the malpractices remain undiscovered. The stress of keen competition in any and every sphere of the activities of our being contributes largely to the practice of dishonesty in a variety of form, and as this determination to get ahead of the other fellow is growing in intensity all the time, the outlook seems not altogether one for decrease, but rather increase. Referring again to the New Haven railroad, we have the declaration of a high official of the Government, following a careful investigation of conditions that "the powers that were did everything except run a railroad."

Education, philosophy and cultivation of intelligence are not only now within the reach of all who care to avail themselves of their acquirement, but are in addition being appropriated and effectively applied in the testing of men and things material, and only the lack of the most elementary intelligence on the part of a large percentage of men in high places, or a surfeit of avarice blinds them to the fact that they are being shadowed by the detectives of public opinion. In politics and affairs municipal, votes are paid for directly and indirectly, and in too many industrial and other corporations, the prosperity of the financier, and not the commercial interests of his community or his country, much less the welfare of the employees is the sole ideal. Is it surprising, therefore, when the names of some public men are mentioned that suggestions of honesty—plain, simple, downright honesty, are ridiculed?

Finance enters into all enterprise as a necessity, but finance, it is too often forgotten, is but a means to an end, and not that end. How often, however, do we find it both the means and the end, and the latter in more ways than one. Many industrial enterprises would still have been in existence had high finance not crushed them out, and many of those which to-day are wobbly would have been firmly established and flourishing had the like sinister influence not been allowed to usurp the real purpose of their being. Legislation, however drastic, will never make men honest, if for no other reason than the fact that those who legislate for us come far short of infallibility with respect to wisdom, justice and even common-sense. It may be said in reply that our rulers are but a reflection of ourselves, but this is only true in part, for it cannot be said with honesty of conviction that they are so representative.

Business enterprises, if run as purely financial institutions, are a menace to the progress and development of any country, and affect unfavorably the welfare of its citizens, besides courting ultimate ruin for those directly interested. In support of this statement, we don't have to cast around very much or very far for convincing proof. Much has been written relative to the display of earnest, honest, whole-hearted effort on the part of employees, but little is to be found which calls for honest business methods and administration on the part of those to whom this duty and privilege has been given.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Feb. 2, 1914.—Money is gradually becoming easier, the result making itself felt in the steadily-improving tone of the stock market. The rising prices of leading stocks form an encouraging sign that the present depression in trade is passing away. Present indications are that some little time must still elapse before business resumes its normal volume; in other words, the improvement is likely to be very gradual. The fact that people still have plenty of money to spend on luxuries is another proof that times are not so bad as some would have us believe. A record is said to have been made in the matter of sales at the Montreal motor show, the pleasure car section of which closed on Saturday last. The commercial car show opens to-morrow for the balance of the week, and will be a thoroughly representative exhibition.

The demand for pig iron continues fairly good and prices remain firm. The position of the steel and iron market is also improving.

Copper continues to show an improved tone, but the feature of the metal market is the rise in tin which has taken place during the past week. It is now being quoted locally at $42.00, as against $40.00 a week ago. This is due to bull manipulation on the London market, and in view of the present statistical position of this metal, the price is likely to remain high for some time. This at least is the opinion expressed to-day by a prominent Montreal firm of metal merchants.

There is a well-defined rumor circulating to the effect that the Borden Government are about to reduce the import duty on agricultural implements. It is stated that they will not accede to the demand for free wheat, which is being strongly opposed by the milling and railway interests. The Government take the stand that while refusing to grant free wheat, it will assist the farmer by reducing the duties on his implements.

The coming spring will see still another line of steamships on the St. Lawrence, as the Hamburg-American Line, who have just opened an office here, will then commence a freight and passenger service between Hamburg and Montreal. In fact, they are to commence their Canadian passenger service during the present week with the sailing of S.S. Armenia from Hamburg for Halifax, N.S., on February 7. This service, however, will only be westbound until navigation on the St. Lawrence opens again.

Toronto, Ont., Feb. 3, 1914.—An Ottawa foundry proprietor remarked to one of our representatives recently that Summerlee pig iron was not being quoted in Canadian Machinery, adding that he had been buying that for years in Montreal. Summerlee pig is made in Great Britain, and is considered one of the best made for a certain kind of work. There are several manufacturers up and down the country who will pay almost any price for this brand, but, for the present, it is off the market, the price being too high to compete with Canadian and American iron. Drummond, McCall & Co., Montreal, we understand, still supply it to some of their old customers who insist on having Summerlee.

The pig iron market is gradually improving with business generally, and the price is tending upwards. The prices quoted in Canadian Machinery for Victoria brands are chiefly for small quantities, better prices being available for large quantities.

Steel Market.

The demand for steel bars, etc., from warehouse is not very big at present. Warehouse customers are now able to buy from mill, as three weeks' shipment can be guaranteed. That condition, however, will not last for long. Most buyers of steel are getting under cover. The larger consumers feel that the market will shortly be rising, and do not wish to buy at high prices. Demands for steel are not confined to one class of manufacturer. Orders were placed this week by a large engine works, an elevator firm, a firm manufacturing fire doors, another making ornamental stairs, two structural steel firms, and a large boilermaker.

One of the features of the week has been the big demand for supplies from large boiler manufacturers and shipbuilders. The boiler tube trade is opening up splendidly, chiefly for new boilers and railroad work. The tendency is to use seamless tubes for stationary boilers. Shipbuilding firms in and around Toronto bought heavily during the last three months, and the steel is now on the ground.

Canal Contractors Buying.

Contractors on the new Welland Canal are buying extensively from warehouse, their chief requirements being wire rope, plates, bars, tubes, etc. The order for steel plates for making the Toronto intake pipe has been placed by the Thor Iron Works with Drummond, McCall & Co., Toronto, amounting to about 1,000 tons. This will be supplied by the Carnegie Steel Co.

The price of steel sheets is stiffening up. The price of all sheets dropped considerably during the latter half of 1913. There is a fair demand. Prices of bars, bolts, etc., and wrought iron pipe are unchanged. Some of the implement makers bought steel bars during the week, but business is not big enough yet to warrant large purchases. Canadian steel companies are preparing to increase their price of steel bars following the stiffening across the line. The Steel Company of Canada are operating their furnaces at Hamilton full.

Machine Tools.

While the steel business shows marked signs of improvement, the machine tool and supply market continues quiet. This business will have to wait until the basic trades have got into good shape again. There are several small inquiries for machine tools, small orders being rather plentiful, which is a hopeful sign, showing that the general tone is good. No-

thing has been heard yet regarding the big order for machine tools required by the Michigan Central Railway for their new shops at St. Thomas. In the Windsor district, from which inquiries usually come freely, things are quiet. The Hamilton Bridge Co., Hamilton, who were in the market recently for a large number of tools, have placed their order.

St. John, N.B., Feb. 2, 1914.—The approach of spring sees many hopeful signs with regard to industrial progress and activities in the Maritime Provinces and various firms are planning business development. Plans were last week laid before the city commissioners for a manufacturing plant on the Marsh Road involving an outlay of $2,000,000 by George McAvity and A. P. Barnhill, the plant to give employment to about 1,500 men. A request was made for a fixed tax rate for a period of forty years, the company undertaking to pay $5,000 in taxes each year if the request were granted. Mr. Barnhill said it was the intention to form a new company to take over the McAvity business and enlarge it, and that the capital for the new concern was already assured. The initial unit of the plant to be erected on the Marsh Road would cost about $300,000 while extensions contemplated would would make a total expenditure of about $2,000,000. The company desires the right to rail connections with the I.C.R. with a level crossing, and to supply electric light, power and telephone service, and to carry wires to its buildings on either side of the road. An agreement in the matter will be made at a later date.

A new pork factory, with modern equipment and large capacity is to be established in St. John. To accomplish this, a company has been incorporated by Provincial charter under the name of the New Brunswick Packing Co., Ltd. Organization has been completed with the following board of directors:—J. M. Robinson, president of the Board of Trade; D. F. Pidgeon, A. C. Corfield, C. N. Kennealy and W. W. Corfield. T. H. Foster has been appointed secretary-treasurer, and Barton, Mayhew & Co., auditors. The authorized capital stock is $99,000. The factory will be modern in every particular.

The contract for the concrete superstructure for the new wharves at Carleton has been awarded to the E. G. M. Cape Co., Montreal, who are now in charge of the massive stone work being erected at the plant of the Atlantic Sugar Refineries, Ltd. They will assemble a complete and powerful equipment for their operations which will be started in April. The crib work will be built by D. C. Clark, of St. John.

ANNUAL MEETING OF C. S. C. E.

THE Canadian Society of Civil Engineers held their twenty-eighth annual meeting in Montreal, January 27-28, when Mr. M. J. Butler, of Armstrong-Whitworth, of Canada, Ltd., was elected president for the current year. Mr. R. A. Ross, the well-known Montreal consulting engineer, was chosen vice-president. The vote on the members of the council, who sit for three years each, resulted as follows:—

District No. 1, J. M. R. Fairbairn, H. M. McKay; No. 2, R. McCall; No. 3, A. R. Decary; No. 4, R. F. Uniacke; No. 5, W. A. Buck; No. 6, F. Lee; No. 7. I. R. C. Conway.

According to the financial report, the receipts of the society for last year amounted to $22,506, made up principally from dues, which came to $21,386. The property at 176 Mansfield street, valued at $91,500, is owned by the society. In addition to this, there is a bank deposit of $5,000, books valued at $6,000 and nearly $300 in cash on hand as well as various other assets. A mortgage of $20,000 on the property is the chief liability.

At the first session on Jan. 27, an important resolution was adopted calling upon the Dominion Government to take up the question of co-ordination of surveys and the establishment of some system of recordiong information as to surveys and maps in such manner as to make it available not only for the public but for all the Government departments as well. At present one department has no means of learning what is being done in another department, and it was felt by the society that this state of affairs should not be allowed to continue. Some years ago, the Government appointed a commission consisting of heads of departments, and this commission presented a report but no further progress was made.

It is now proposed that the work be taken up where the commission left off, and the Government will be urged to provide a system for the exchange of information between departments and thus eliminate the overlapping that now takes place.

At the afternoon session, Jan. 27, a new committee was appointed to revise the society's specifications for cast iron water pipes. Afterwards, the retiring president, Mr. Phelps Johnson, gave his annual address in which he drew attention to a feeling that had been voiced by some members against the admission of foreign engineers to take charge of works in Canada. This he thought a mistake, and warned them against adopting labor union methods. He also thought the members lacked enthusiasm for the welfare of the society, and urged them to take a more lively interest by providing and reading papers on engineering problems at short intervals.

On the second day of the convention the members paid a visit to the works of the St. Lawrence Bridge Company, at Rockfield, and in the evening the annual dinner was held in the Engineers' Club. Mr. H. H. Vaughan, a past-president, presided in the unavoidable absence of Mr. Phelps Johnson.

The third day was occupied largely with routine business, announcement of elections of officers, etc. The convention was attended by 340 members drawn from all parts of the Dominion.

INDUSTRIAL WELLAND DURING 1913.

THE accompanying figures and data relative to the industrial activities of Welland, Ont., during 1913, were recently presented to the members of the Board of Trade of that town, and serve to show that no lack of successful effort marked the work the industrial commissioner, Mr. B. J. McCormick.

Mfg. plants in operation, 25; increase over 1912, 3.
Employees on 25 pay sheets, 2,872; increase over 1912, 196.
Wages paid by 25 plants, $1,642,996.25; increase over 1912, $158,849.25.
Product shipped by 25 plants, $8,835,573.00; increase over 1912, $1,770,607.00.
Improvements charged to capital account by 25 plants, $1,733,490.72; increase over 1912, $1,169,825.00.
Building permits inside town limits, $611,157.50; increase over 1912, $141,413.50.

During the year three new manufacturing concerns were secured and are now erecting plants.

Marine

Ottawa, Ont.—The estimates include a sum large enough to finish the Trent Valley Canal. The last contract for the upper end will be let this month, and the work below Peterboro will all be done by August 1st. Every effort is being made to get this waterway opened as soon as possible.

Prince Rupert, B.C.—Activity is now being manifested at the $3,000,000 dry-dock under construction for the G.T.P. railway and steamship interests. Immense quantities of steel for structural purposes, lumber and machinery are arriving weekly, the last being a 1,500-ton consignment now being unloaded from the steamship Kentra. The steel frame of the foundry is finished, and that for the numerous other buildings will shortly be in place. The floating dry-dock, according to plans furnished by William T. Donnelly, will have a liftiug capacity of 20,000 tons, and is so designed as to be capable of operating in sections as a number of smaller docks.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Stratford, Ont.— The Grand Trunk Railway Co. is contemplating building new shops here.

Owen Sound, Ont.— A plant for the manufacture of steam rollers and a box factory are expected to locate here.

New Westminster, B.C.—An American steel company is negotiating with the city for a site on which to build a plant.

Niagara Falls, Ont. — The Dominion Chain Co., Ellen avenue, are asking the town for a free site on which to build a plant.

Berlin, Ont.—Work on the automobile factory to be built by H. Nyberg will begin early in March. It will measure 250 x 250 feet.

Toronto, Ont. — Foundry Specialties Co., Cherry street, have had plans prepared for the reconstruction of their foundry. W. S. Thompson, Toronto, architect.

Brantford, Ont. — Templeton Bros., makers of electric ranges, whose plant was recently destroyed by fire in Toronto, have been here looking for a site on which to build.

Fort William, Ont.—The Orpen Conduit Mfg. Co., of Canada, Toronto, who were contemplating the erection of a plant in Fort William, have shelved the matter meantime.

Winnipeg, Man.—The Oribo Manufacturing Co. has been incorporated with a capital stock of $50,000 by John Brockest, Harry S. Price, and others, to manufacture sheet metal, etc.

Toronto, Ont.—A foundry and machine shop will be erected by the Eureka Smoke Consumer Co., of Canada, Ltd., who will manufacture smoke consumers, etc. Sydney H. Stott and M. S. Goodcrham are interested.

St. John, N.B.—The Portland Rolling Mills have secured the contract for supplying the Intercolonial Railway with refined iron for the year. The contract will keep the plant running for a year.

Halifax, N.S.—It is understood that at the next annual meeting of the Nova Scotia Car Works, Ltd., announcement will be made that the company proposes to enter on the manufacture of structural steel.

New Westminster, B.C. — The Heaps Engineering Co., Ltd. advise that owing to the financial stringency construction work on their new plant has been abandoned, and orders for tool equipment delayed indefinitely.

St. Catharines, Ont.—A portion of the plant of the Steel and Radiation Co., which has not been used for some time will be operated this week, and the number of employees increased by thirty. New machinery is being installed.

Lethbridge, Alta. — The Automatic Hose Coupler Co., at their annual meeting, recently, decided to erect a factory here. The company is capitalized at $100,000. An American concern is at present manufacturing this coupler.

MACHINE TOOL INQUIRIES.

The De Laval Dairy Supply Co., Peterborough, Ont., who recently erected a plant for the manufacture of cream separators, etc., have transferred a large quantity of machine tools from their old factory in St. Johns, Que. They also purchased a number of second-hand tools about a year ago. Additional equipment is now required to complete their outfit, consisting of: One cutter grinder, one tool-room lathe, one 20-inch drill, one 30-in. planer, one heavy duty drill, one 24-in. shaper, and one horizontal boring, drilling and milling machine.

Another order that several houses are trying to land is that for a traveling crane and a pipe and bolt-threading machine for the Loughead Machine Co., Sarnia. This firm states that the majority of machine tools required for their new shop have already been purchased.

Pembroke, Ont.—The Steel Equipment Co., Ltd., who have built a new factory, advise that they took over the plant and equipment of the Eclipse Mfg. Co., and have all the machine tools they require meantime. D. P. Cruikshank, managing director.

Calgary, Alta.—The Alberta Wire Nail Co. have asked the city for a loan of $50.00 to increase the capacity of the plant. From 110 to 125 kegs of nails are being turned out daily, and an extension is necessary to cope with orders. O. G. Devenish, manager.

Pembroke, Ont.—The Steel Equipment Co. has completed in the west of the town a reinforced concrete factory, 100 by 400 feet, where it will manufacture steel office equipment such as filing cabinets, vault fittings, etc. This company bought out the Eclipse Mfg. Co.

Quebec, Que.—H. C. Carrier has rented the shops formerly occupied by Carrier, Laine & Co., of Levis, and after making extensive repairs to the plant, will start up in the general engineering business. These premises were last occupied by the Canadian Shoe Machinery Company.

Sydney, N.S. — The Dominion Steel Corporation plant, which had been closed down two weeks for repairs, reopened last week. Mr. C. Stanley Martin, general superintendent, stated that sufficient orders have been received to keep the works going at full blast until well along into the summer.

Toronto, Ont.—It is unlikely that the Board of Education will buy machine tool equipment for the new Technical School until early next year. In the meantime, however, four motor-driven lathes, and perhaps a milling machine, will be purchased for the old school. J. W. McBean will issue the specifications.

Sault Ste. Marie, Ont. — Vice-President J. Frater Taylor of the Lake Superior Corporation stated last week that his company has decided to let the contract at once for the construction of another open hearth furnace at the big steel plant. This is the first step in the company's proposed scheme to spend upwards of three million dollars on extensions.

Toronto, Ont.—R. J. Fleming, general manager of the Toronto Railway Co., announces that plans are being prepared for the construction of two new barns, and for the overhauling of 500 street cars. The general manager stated that work on the cars would be commenced as soon as the 25 new ones now in hand were completed.

Ottawa, Ont.—The Campbell Steel & Iron Co., Carling street, have built foundations for an extension to their blacksmith shop, 40 x 60 feet, to be completed in the spring. A one-storey extension to

the erecting shop, measuring 100 x 100 feet, will be commenced early this year, part of which will be used as a machine shop. The firm will supply the necessary structural steel themselves.

Maple Creek, Sask.—The Gilbert Hunt Manufacturing Co. have purchased a site on Jasper street, and in the spring will erect a plant costing between $75,000 and $100,000 for the manufacture of farming implements of all kinds, employing from 400 to 500 men. The Maple Creek Light, Power & Milling Co. will supply the power. The directors are: Gilbert Hunt, J. H. Fleming, D. Kearns, R. S. Hodson, and others; the capital, $700,000.

Collingwood, Ont.—The Imperial Steel and Wire Co., Ltd. will add a screw and bolt mill to their plant, employing 60 additional hands per shift, and costing not less than $50,000. Up to the present, the company have manufactured wire and nails, their output running to over forty tons of finished material per day, and over a million dollars a year. The town is asked to guarantee their bonds to the extent of $100,000, and voting on a by-law takes place on Feb. 24. J. A. Currie, president; S. H. Lindsay, manager.

Lindsay, Ont. — The Boving Co., of Canada, who recently purchased the Madison-Williams plant here to manufacture their hydraulic machinery, laid foundations for an addition to the machine shop, but frost came before the walls were up. Temporary walls were however, erected. Castings from 7 to 8 tons are now being made in the foundry, but a new up-to-date shop will be erected during the coming year, to be used as an iron and brass foundry. The present foundry will then be used as a pattern shop. The contract for structural steel will be let this week.

Electrical

Stratford, Ont.—Extensions to the electric lighting system will be made.

Montreal, Que.—A new signal service system for the police force will be installed at a cost of $100,000.

Prince Rupert, B.C. — The city will spend $45,000 on an extension to the electric light pole line system.

Nickelton, Ont.—The Canadian Nickel Corporation are preparing plans to generate their own electric power at this point.

Terrebonne, Que. — The plant of the Terrebonne Light, Heat & Power Co., recently suffered by fire to the extent of $4,000.

Fort William, Ont.—The Street Railway Committee are negotiating with the Kaministiquia Power Co. for the purchase of a generator.

Brantford, Ont.—The Waterworks Department will probably be in the market shortly for an electric pump, costing about $25,000.

Regina, Sask.—Superintendent Bull, of the civic power department, has recommended that slot meters be installed for light consumers.

Parry Sound, Ont.—By-laws providing $4,500 for rights on the Sequin River that would give the town power for its waterworks and light plant have passed.

Embro, Ont.— The Township Council of East Nissouri are taking steps to see that the proposed Hydro radial from London to Stratford passes through the township.

Goderich, Ont.— The Marine Department has decided to install at the Port of Goderich one of the most powerful electrically operated fog horns in Canada.

Killarney, Man.—The Killarney Electric Light Co. has changed hands. The former owner, Mr. Collison turned the plant over to the purchaser, Mr. Vipond, on February 1.

Paris, Ont.—G. H. Armstrong, electrical commissioner, has informed the town council that $15,000 more will be required to complete the installation of the hydro system. Already $25,000 has been spent.

Thamesford, Ont.—Hydro power was turned on Tuesday, Jan. 27. The municipality is consuming 210 h.p. There are 32 ornamental lights about the streets. Several mills in town have contracted for the current.

Kelowna, B.C.—Active operations are planned in connection with the Belgo-Canadian Land Co., hydro-electric project at Mission Creek, 15 miles from Kelowna, in the Okanagan Valley. It is proposed to develop 2,000 h.p.

Collingwood, Ont.—The Imperial Wire and Steel Co. have made a contract for 350-h.p. Hydro-Electric power, to be supplied some time this month. Another 100 h.p. will be necessary for a new addition shortly to be erected.

Maisonneuve, Que.—The shipbuilding plant of the Canadian Vickers, Ltd., will be driven by electrical motors, constructed in England by Vickers, Ltd. Current at 10,000 volts will be supplied by the Montreal Light, Heat & Power Company.

Durham, Ont. — The passing of the Hydro by-law in Hanover may possibly hurry the development of the water powers on the Saugeen, of which there are many good ones. Durham has asked the Commission for quotations on 1,500 horse-power.

Englehart, Ont.— The Englehart and Charlton Power Co. expect to complete their power plant at Charlton by May 1. Should additional power be required, arrangements have been made for the development of a further fall of water which would give several extra thousand horse-power.

Fredericton, N.B.—F. W. Barbour, consulting engineer, Boston, has advised the council not to accept the proposition of the Eel River Light, Heat and Power Co. to furnish power to operate the pumping station. He recommended certain changes in the pumping station and filtration plant.

Longueuil, Que. — The Armstrong, Whitworth Co., of Canada, who are building a plant at Longueuil, Que., propose to install a power and lighting plant. Current will be supplied by the Montreal Light, Heat & Power Co., at 22,500 volts, which will be transformed to 2,200 volts.

Fort William, Ont. — For lighting at places yet to be named, the Fire, Water and Light Committee recommend that 50 arc lamps be purchased immediately. The question of fire alarm boxes has not yet been settled. The box made by the Star Electric Co. is to be looked over. The price asked is $102.

Cobalt, Ont.—Negotiations have been concluded for the supply of 800 h.p. to the Tough-Oakes mine in Kirkland Lake. The power will come from the Englehart and Charlton Power Co., Charlton, Ont. A motor-driven air compressor with a capacity of at least 1,200 cu. ft. free air per minute at 100 pounds, will be installed by the Tough-Oakes Co. immediately.

Electric Furnaces.—Two electric furnaces are now in operation at Trollhattan, Sweden, producing ferrochrome from ores brought from South Africa and New Caledonia. Four grades of metal, containing 5, 6½, 7½, and 9 per cent. of chromium, are produced, the current used being 3-phase, 50-cycle, at a voltage varying between 45 and 60 volts. It is stated that the furnaces require 1,700 k.w.-hours per ton of metal reduced, and that the results so far obtained have been satisfactory.

Tenders

Victoria, B.C.—Tenders are being called by the Dominion Government for the erection of two additional storeys to the post office at Victoria.

Montreal, Que.—Tenders addressed to L. N. Senecal, secretary to the Board of Control, will be received until noon, Feb. 19, for the supply and delivery of about 6,750 tons of cast iron pipes.

Ottawa, Ont.—Tenders will be received at this office until February 23, for the installation of an electric passenger elevator to include motor generator set, etc., in the public building, Moose Jaw, Sask. Plans, specification and form of contract can be seen and forms of tender obtained on application to Mr. W. Tilston, clerk of works, Moose Jaw,; at the office of Mr. H. E. Matthews, resident architect, Lindsay Building, Winnipeg, Man., and from R. C. Desrochers, Dept. of Public Works, Ottawa, to whom tenders should be sent.

General Industrial

Hawkesbury, Ont.—The Riordon Pulp & Paper Co. may build their new pulp mill in the spring.

New Toronto, Ont. — The Ontario Leather Co., who have been closed down are opening up again.

Tillsonburg, Ont.—Barkey Bros., with a capital of $40,000, are planning the erection of a canning factory here.

Toronto, Ont.—Gunn's, Ltd., packers, have increased their capital to $2,000,000 to take care of increased business.

Estevan, Sask.—The Great West Brick & Coal Co. are preparing for an early start in the spring on the construction of their plant.

Goderich, Ont.—The Alexandra Marine and General Hospital is asking the council for $15,000 to build a new hospital.

Delhi, Ont. — The Sovereign Mitt, Glove & Robe Co., is erecting a new factory, 33 x 100 ft., to replace the one destroyed by fire.

Melfort, Sask. — A. C. Bowness, of Weyburn, was here last week enquiring into the prospects for a canning factory in Melfort next summer.

Woodstock, Ont.—Wm. Stone, Sons & Co., makers of fertilizers, will build another factory this spring on the west end of the present one.

Sherbrooke, Que.—The Panther Rubber Co. are now receiving consignments of machinery for their new plant. Rubber soles and heels are to be made.

Owen Sound, Ont.—The McQuay Tanning Co., Ltd., makers of harness leather, will double their capacity in consideration of a $25,000 loan from the town.

Welland, Ont.—The Imperial Oil Co., Sarnia, have acquired a piece of property from M. Beatty & Sons, Ltd., for the erection of a storage plant to supply this district.

Montreal, Que.—W. A. Matheson, general manager of the Lake of the Woods Milling Co., was here last week to discuss plans with eastern directors for proposed developments.

New Toronto, Ont.—The plant of the Glass Rolling mill which was burned down two years ago, has been rebuilt at a cost of $200,000, and will start operations again in a few weeks.

Calgary, Alta.—Hon. Clifford Sifton, at a meeting of the Calgary Natural Gas Co. last week, stated that a second trunk main from Bow Island, costing about $4,000,000, would soon be required.

Sault Ste. Marie, Ont.—The Imperial Oil Co., Sarnia, have built a new dock here, and will spend several thousand dollars on oil tanks and equipment for the unloading of oil from steamers.

Napanee, Ont.—Charles Cliff. Vancouver, has been here to secure a site on which to erect a condensed milk factory, costing $50,000. The Rathbun Company own the site he is trying to secure.

Embro, Ont.—J. W. Sim, who has resigned his position as manager of the Wallaceburg Knitting Co. was here last week to confer with business men in regard to starting a knitting factory here.

St. John, N.B.—The New Brunswick Packing Co., recently organized, will establish a pork-packing plant here. It has purchased several farms on which to raise hogs, and made contracts with local farmers.

Collingwood, Ont. — J. G. Sing, chief engineer of the Department of Public Works for Western Ontario, was recently in Collingwood, making an inspection of the waterfront in search of a site for an elevator.

Stratford, Ont.—B. F. Kastner and M. M. Bricker are shareholders in a company making gloves here, employing 30 hands, who will move their plant to Waterloo, Ont., owing to difficulty in obtaining help.

St. John, N.B. — Oil Processes, Ltd., recently incorporated, have purchased the shale lands of Senator Domville, of Rothesay, N.B., and will manufacture cement, sulphate of ammonia, and oil for fuel purposes.

Medicine Hat, Alta. — The Medicine Hat Pure Milk Co., will purchase dairy machinery for a dairy now being built. A pasteurizer will be required later.

Brantford, Ont.—The United Rubber Co., reclaimers of old rubber, have purchased the Farmers' Binder Twine Co. factory, and after installing machinery, will start operation with thirty hands.

Vancouver, B.C.—Plans of the Standard Oil Company are going forward for the location on Burrard Inlet of an oil refinery to take California crude oil and extract the products for the Western Canadian market.

Dr. Richard Moldenke, for many years general secretary of the American Foundrymen's Association, has resigned that position, his resignation being accepted by the executive committee of that organization, January 17, at a meeting at the Hotel La Salle. Dr. Moldenke has been seeking for some time to be relieved of the burden of his duties, and the committee felt it incumbent on itself to accede to his request. In order that his services in a measure may be retained he has been tendered the position of editorial and foreign secretary. No definite step has been made to fill the vacancy, but it is expected that an appointment will be made in a few weeks.

Wood Working

Waterdown, Ont.—Dr. Husband is erecting a basket factory here.

Burlington, Ont. — Fire on Jan. 27, damaged the planing mills and lumber yard of A. Coates & Sons.

Victoria, B.C. — The Coast Ranger Cedar Shingles and Lumber Co., Ltd., was incorporated here last week.

Waterloo, Ont. — A woodworking industry has been given permission to start operations in the market building until larger premises are secured.

Vancouver, B.C. — The Cedar Cove Sash & Door Co. have taken out a permit for the erection of a $3,000 factory at 1100 Sixth avenue west.

Port Haney, B.C. — C. T. W. Piper, Burnaby, B.C., is negotiating for 400 ft. of river frontage for a shingle mill, capable of cutting 100,000 to 150,000 shingles a day.

Sydney, N.S.—C. W. Totten, building contractor, is one of several interested in the erection of a large sawmill at Anderson's Point, capable of cutting half a million feet per year.

Toronto, Ont.—The Riverside Lumber Co., Ltd., who are erecting one of the largest box and sash and door factories in the West, advise that they will require machinery this spring.

Dundas, Ont.—The Valley City Seating Co. are building an addition to the plant, and orders have been placed for a number of new machines. The factory has been running full time all winter.

Bishop's Crossing, Que.—The lumber and shingle mill of J. O. Gilbert & Son, at East Dudswell, was totally destroyed by fire on Saturday evening, Jan. 24. Damage over $5,000; some insurance.

Neustadt, Ont.—The new chair factory is completed. Its dimensions are: Main building, 115 x 60, 2-storey; kilns, 36 x 38, engine and boiler room 42 x 48. The plant will be in operation by the middle of March.

Walkerville, Ont. — Plans have been prepared by Stahl, Kinsey & Chapman for a three-storey addition to the American Auto Trimming Co.'s plant. The dimensions of the new addition are 40 x 80 feet.

Contracts Awarded

Galt, Ont.—P. H. Secord & Son, contractors, have been awarded the contract for the construction of the new Galt armory.

Fort William, Ont. — The city has awarded the contract for waterworks supplies to the Northern Engineering Co., and the Canadian Fairbanks-Morse Co., Ltd.

Winnipeg, Man.—John Gunn & Sons have been awarded the contract for the G.T.P. bridge over the South Saskatchewan River at St. Louis, near Prince Albert, Sask. Price $100,000.

New Incorporations

The Hill-Willcox Patents Co., Ltd., incorporated at Toronto, capital $40,000, to promote and procure the establishing of industries in Canada; headquarters at Windsor, Ont.; Incorporators: Walter C. Hill, George B. Willcox, Saginaw, Mich.; John F. Reid, Windsor, Ont.

The Trenton Cooperage Mills, Ltd., incorporated at Toronto, capital $100,000, to take over, operate and extend the cooperage business now being carried on under the name of "Trenton Cooperage Mills, Ltd." at Trenton, Ont. Incorporators: William Stewart, Thomas S. Stewart, etc., Montreal, Que.

The John VerMehr Engineering Co., Ltd., incorporated at Toronto, capital $1,900,000, to acquire from the Ransome VerMehr Machinery Co., Ltd., of London, England, the benefit of certain existing inventions and the good-will of the business of the said company in Canada and of the VerMehr Machinery Co., and the VerMehr Engineering Co., both of Toronto. Incorporators: John VerMehr, London, Eng., William Storrie, etc., Toronto.

The Gibbons-Kemp Co., Ltd., incorporated at Ottawa, capital $40,000, to manufacture patented vacuum clothes' washers and fuel-saving devices for stoves, furnaces and sectional boilers; to acquire the good-will, rights, property and assets of the Dominion Specialty Mfg. and Sales Co., successors to the Miracle Vacuum Washer Co., of London, Ont., at London. Incorporators: Willie H. Gibbons, Harold R. Kemp, etc., London, Ont.

The Viger-Foster Valve Co., Ltd., incorporated at Ottawa, capital $250,000, to carry on the business of mechanical engineers and dealers and manufacturers of plants, engines and other machinery, tool makers, brass founders, metal workers, boiler makers, machinists, iron and steel converters, smiths, builders, metallurgists, valve manufacturers, electrical, civil and water supply engineers at Montreal. Incorporators: Edgar R. Parkins, William Taylor, etc., Montreal, Que.

Municipal

Sarnia, Ont. — The town council is considering the purchase of road machinery.

Toronto, Ont.—The council last week decided to extend Teraulay St. north as far as Davenport Rd., at a cost of $1,250,000.

Winnipeg, Man.—The Good Roads Act which provides $2,500,000 for market roads and bridges in this Province, will shortly receive its third reading.

Windsor, Ont.— Fire Chief Murray advises the erection of three new substations. He asks for an auto for himself, and a tractor for aerial truck, and a city service ladder truck.

Toronto, Ont.—The Toronto Housing Co. may install a private central heating system on Bain Avenue, in connection with its housing development in that vicinity, if a recommendation by Works Commissioner Harris is approved by his committee.

St. Catharines, Ont.— The ratepayers defeated a by-law to grant $100,000 bonus to the C.N.R. to put the city on the Toronto and Niagara Falls main line. A by-law to grant a three-acre site and fixed assessment to the Consumers' Rubber Tire Co. also failed.

Regina, Sask. — The city will spend $500,000 on extensions to the waterworks system. In all likelihood a 27-inch main to the source of supply at Boggy creek will be laid, and a number of new wells opened up in a section of the Boggy creek watershed hitherto untapped.

Medicine Hat, Alta.—Projected for 1914 are the following: — Sewerage pumping plant, $10,000; outlet for same, $12,000; storm drains, $50,000; new water mains, from 8 to 10 miles; additional pumping unit and addition to the present new filtration plant, $16,000.

Sudbury, Ont.—A scheme to provide the towns of Copper Cliff and Frood Mines with a pure water supply at a cost of $200,000, and provide for a population of 17,000, has been planned. The work of construction will commence without delay. The Canada Copper Co. will finance the work. A high-pressure pumping station and a 100,000 gallon storage tank in Copper Cliff of reinforced concrete is part of the scheme.

Hamilton, Ont.—City Engineer Macallum has submitted an exhaustive report on the city waterworks system. The secretary of the Underwriters' Association, recently recommended going back to steam power for pumping and other changes. Mr. Macallum thinks that the city should have a duplicate pumping plant, as it now has a duplicate system of pipes. He also suggests as an alternative that the city take power from the Cataract Company and have devices for using either Hydro or Cataract power. The additional steam plant will cost $65,000.

Marine

St. John's, Nfld.—The Maritime and Newfoundland Steamship Co., Ltd., are having a large steel screw steamer built on the Clyde by the firm of Bow & MacLachlan, Paisley, Scotland.

Whitby, Ont.—The town council has under consideration a proposition from some United States promoters for the establishment of a car ferry between Whitby and Olcott, N.Y., involving an estimated expenditure of $1,500,000.

S.S. Royal Edward. — The Canadian Northern Railway Co.'s steamer Royal Edward recently left Cammell Laird & Co.'s docks at Birkenhead after an ex-

tensive overhaul. Her sister vessel, the Royal George, will shortly be sent to Birkenhead for her annual refit. Cammell Laird & Co. have recently shipped to New York new turbines for the Canadian Pacific Railway Co.'s steamer St. George, and these are being fitted under the superintendence of engineers sent out from Birkenhead.

Refrigeration

Toronto, Ont.—Puddy Bros., Ltd., packers, have increased their capital from the sum of $100,000 to $200,000.

Medicine Hat, Alta.—It is practically certain that William Davison, of the Crystal Ice Co., Calgary, will build an artificial ice plant here. Negotiations with the city council have been completed.

Haysport, B.C.—W. H. Greenwood, president of the Skeena River Fisheries, Ltd., has announced that the company's plant here will be enlarged to store 1,500,000 lbs. of frozen fish, work to commence March 1.

Windsor, Ont.—The contract for an ice plant, of fifty-ton daily capacity, has been awarded by Green, Klingensmith & Wallace to the Canadian Ice Machine Co., of Toronto, and the York Manufacturing Co., of York, Pa. Contracts for material and the erection of the necessary buildings will be let in a few days.

Edmonton, Alta.—With a total capitalization of $50,0000, a company has been incorporated under the name of the Mill Creek Cold Storage Co., and will take over the old Vogel meat packing plant, until recently occupied by P. Burns & Co. They will adapt the premises to meet every requirement called for in an up-to-date storage plant.

Railways—Bridges

Hamilton, Ont.—A bridge connecting the McKittrick survey with the city will be rushed.

Winnipeg, Man.—The Street Railway Co. is preparing plans for an extension to Transcona.

London, Ont.—The Grand Trunk Railway Co. has agreed to build a two-mile extension to the Harris farm, on which the new race track is to be located.

Victoria, B.C. — The Kettle Valley Railway will make application for a charter extension to run a line from Otter Summit into Aspen Grove to tap Copper Mountin.

London,. Ont.—The city will urge the London Street Railway Co. to put on twelve or fifteen extra cars to handle local business, as outlined by City Engineer W. N. Ashplant.

Windsor, Ont.—Mayor Woolatt, of Ojibway, favors the installation of a municipally-owned street railway to connect Windsor, Walkerville, Sandwich, Ford City and Ojibway.

Ottawa, Ont.—The city and county councils will contribute towards the cost of a bridge over the Rideau River, Main Street, Ottawa East, costing $40,000. B. Slattery and R. A. Hurdman are urging its erection.

Brantford, Ont.—Work on the construction of the Lake Erie and Northern Railway, which has been suspended for some time, will resume immediately. Secord & Sons will take over the contract of Wright, Cohen & Hazzard, a Buffalo firm.

Ottawa, Ont.—Application will be made to Parliament this session for the incorporation of the North-Western Railway Co. of Canada, which it is proposed to run from near the Athabasca River through Edmonton to Winnipeg and Port Arthur.

St. Thomas, Ont. — Vice-President Wood, of the London & Lake Erie Transportation Co. will arrive in St. Thomas this week to continue negotiations with the municipalities for the extension of the line from St. Thomas to Aylmer and from Union to Sparta.

Welland, Ont.—The construction of an electric railway system from Welland to Port Colborne and along the shore of Lake Erie to Fort Erie, and from there along the Niagara River to Niagara Falls, was decided upon at the annual meeting of the Niagara, Welland and Lake Erie Railway Co. held in Toronto last week. Extensions of the Welland Street Railway on North Main to Parkway Heights and to Rosedale are also to be started at once.

Trade Gossip

Cowansville, Que.—The Norwood Engineering Co., makers of filtration plants, are increasing their staff.

The Wabi Iron Works, New Liskeard, Ont., who have been handling some big work of late, held their annual meeting on Wednesday Jan. 28.

Moulders' Picnic.—A monster picnic is being arranged by moulders in Ontario to be held in Exhibition Park, Guelph, on July 4, next.

Ver Mehr Engineering Co., recently incorporated, is one of two tenderers for building Toronto's million-dollar filtration plant. The other is the New York Continental Jewel Co.

The Jenckes Machine Co., Sherbrooke, Que., employing between four and five hundred hands, state that their pay-roll and business are as large as they were last year.

Ottawa Board of Control is considering the advisability of having the city's boilers insured in view of the recent explosion at Howick Hall, in which three lives were lost.

Niagara Falls City Council have resolved to memorialize the Provincial Government to make such a law as would effectually abolish the pernicious practice of bonusing industries.

For Ojibway?—At the recent meeting in New York of the United States Steel Corporation, the directors appropriated $10,000,000 from the surplus for expenditures made and to be made, presumably at Ojibway on the new plant that will be built there.

Drummond, McCall & Co., Montreal, wrote the Ottawa Waterworks Committee last week, asking if tenders called for steel pipes to be used for the Gatineau lakes scheme would be considered. The mayor said no advice could be given until a plebiscite had been taken.

The Montreal Metal and Hardware Association, Montreal, held their annual dinner at the Montreal Club, on Wednesday, Jan. 28. George H. Crowdy, president, occupied the chair. Among other guests were Controller Godfrey and Col. A. E. Labelle, Harbor Board Commissioner.

T. J. Brown, general superintendent of the Nova Scotia Steel and Coal Co., and Vincent McFadden, chief electrician of the Dominion Coal Co., Glace Bay, N.S., are members of a commission appointed by the Nova Scotia Government to inquire into the advantages or otherwise of electricity for light, heat and power in coal mines. The commission visited Sydney last week.

H.M.S. Algerine was recently injured off Victoria, B.C., and the contract for repairing her has been awarded to a Seattle firm. Two bids for the work were tenders by Victoria firms which are alleged to have been lower than that of the American firm. Cables have been sent by several parties to the British Admiralty for an explanatiou, it being alleged by local shipbuilders that Victoria is being discriminated against by His Majesty's officers.

The A. R. Williams Machinery Co., Ltd., 64-66 Front St. W., Toronto

Saskatoon is advertising for a city engineer.

Foundation Co., Ltd. officials and employees held a banquet in the Engineers' Club, Montreal, Jan. 26, at which were present: Franklin Remington, president of the Foundation Co., of the United States, New York; Henry Holgate, consulting engineer; Lawrence Macfarlane, legal adviser; James Freeburn, an American engineer; John W. Doty and H. Wood, superintendents; and other officials from all over the Dominion, the gathering numbering about sixty.

Turbine Equipment Co., Ltd., Toronto, have been awarded the contract for the following motor-driven pumps from the Cobalt Lake Mining Co., Ltd., for draining Cobalt Lake:—Three De Laval single stage, double suction, centrifugal pumps, each having a capacity of 3,500 gallons a minute against 100 ft. head, and two 3-stage pumps, each having a capacity of 600 gallons a minute against 360 ft. head. All these pumps will be equipped with manganese bronze impellers, as there will be a very large amount of grit in the water.

Building Notes

Toronto, Ont.—St. Michael's Hospital will be enlarged during the coming summer at a cost of $150,000.

Personal

J. Gilbert will conduct a class in forge work at Edmonton Technical School.

E. D. Pitt has been appointed industrial commissioner of Niagara Falls, Ont.

Hon. Adam Beck has returned from England much improved in health by his holiday of two months.

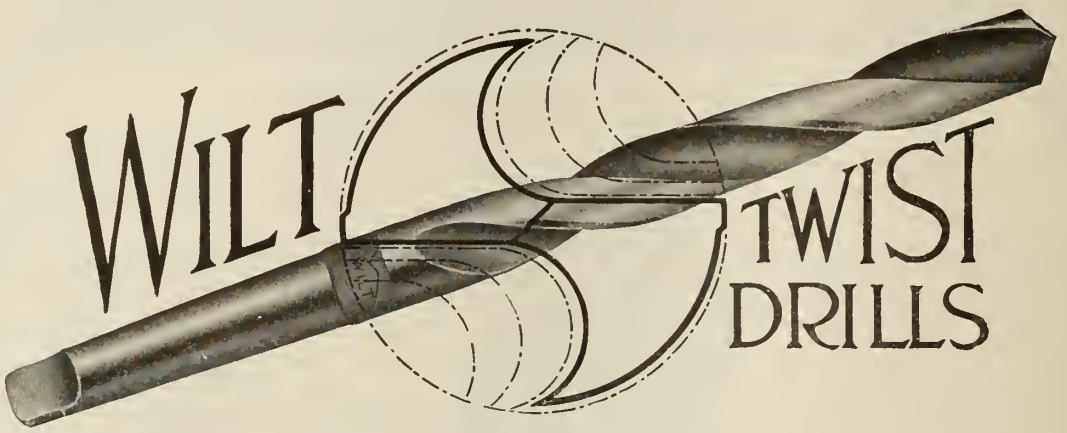
John Pinder-Moss has been appointed instructor in mechanical drawing at Edmonton Technical School for evening and day classes.

M. J. Butler was elected president of the Canadian Society of Civil Engineers at their twenty-eighth annual meeting held in Montreal last week.

E. E. Turner, of the safe department, Canadian Fairbanks-Morse Co., Toronto, has been transferred to Montreal, to manage the same department there.

F. R. Humpage, formerly general manager of the Thomas Motor Car Co. of Buffalo, has been elected treasurer of the International Chemical Co. of Canada, Bridgeburg, Ont.

Colonel Ruttan, Winnipeg city sngineer, last week addressed the University of Manitoba Engineering Society. The next lecture will be given by W. G. Chase, on February 9.



Professor Herdt, of McGill University, and R. L. Kelsch, consulting engineer, are inquiring into the cost of power as furnished the City of Fort William by the Kaministiquia Power Co.

Thomas L. Willson, former president of the International Marine Signal Co., Ottawa, has resigned from the board of directors. Lewis Lukes has been elected president of a new board.

John Mills, mechanical superintendent of Gooderham & Worts, brewers, Toronto, had his car struck by a C.P.R. freight train at a crossing on Tuesday, January 20, and only saved his life by leaping over the front of the car.

Sir John Luscombe has been elected chairman of Lloyd's for 1914. He has already acted in this capacity several times in the past, and it was during one year of his chairmanship that the arrangement for the annual audit of Lloyd's accounts were successfully inaugurated.

Colonel Geo. W. Goethals will, on April 1, become the first civil governor of the Panama Canal zone, and that date will also mark the inauguration of permanent government, according to an executive order signed by United States President Wilson at Washington on January 27.

Wilt Twist Drills are made from the rough stock to the finished drill at a single chucking.

The circular diagram above shows the process—the three roughing cuts—the finishing cut and the relieving cut all taken before the drill is released from the chuck.

This produces a drill of marvelous accuracy and uniformity — with a clearance that is clean-cut and well-defined—and a groove contour that is scientifically perfect.

Wilt Twist Drills will do the hardest work you have in your shop with an ease and effectiveness that will surprise you.

The Wilt Twist Drill Company of Canada,
LIMITED

WALKERVILLE, ONT.

J. A. Jamieson, R. S. Lea and G. R. Heckle have been retained by the Board of Commissioners of Montreal to make a report as to the cause of the recent failure of the intake conduit.

F. Ross Newman, resident manager in Toronto of the Canadian Fairbanks-Morse Co., sailed from New York on Saturday for Europe, where he will spend a short holiday. During his absence George E. Fisher is in charge.

Obituary

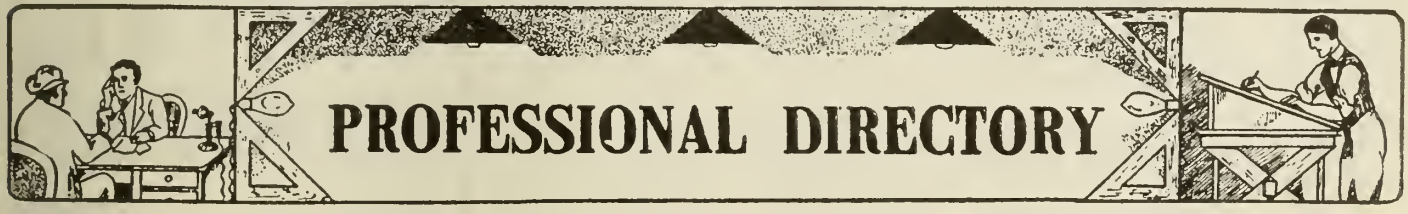
R. W. Green, chief engineer at the Ontario Agricultural College, Guelph, Ont. for 20 years, died Jan. 20.

J. J. McLaughlin, son of Robert McLaughlin, of the McLaughlin Carriage Co., Oshawa, died in Toronto, Jan. 28.

Hon. J. Stewart Pitts, C.M.G., a former Newfoundland Cabinet Minister, and a director of the Nova Scotia Steel & Coal Co., died in St. John's, Nfld., Jan. 28.

William John McKee, Windsor, Ont., who was for some years superintendent of the Grand Trunk shops there, died last Thursday. He was 49 years of age.

Edwin Greenland, of the Canadian General Electric Co., Peterborough, died while on a visit to Orillia on January 10. He was formerly employed by the Long Mfg. Co., Orillia, and the Collingwood Shipbuilding Co. By profession he was a marine engineer, and most of his life was spent with the Peninsular and Oriental Steamship Co. and in the British Government Dockyards, Portsmouth.



Catalogues

Status Prize.—The Council of The Society of Engineers (Incorporated) may award in 1914 a premium of books or instruments to the value of $50.00, for an approved essay on "The Status of the Engineering Profession." The Council reserve the right to withhold the premium if the essays received are not of a sufficient standard of merit. The competition is open to all, but, before entering, application for detailed particulars should be made to the Secretary, 17 Victoria Street, Westminster. The last date for receiving essays is May 30th, 1914.

The "Doehler" babbitt-lined bronze bearings are fully dealt with in a pamphlet which we have received from Eugene Michel & Staff, New York, on behalf of the Doehler Die Casting Co., Brooklyn, N.Y. These bearings are specially adapted to motor car engines, for connecting rods and main journals, the reason for this being explained clearly, as is also the method used when babbitting. A number of illustrations are included showing the various types of bearings. Copies of the pamphlet will be sent to interested readers upon request.

Morris Overhead Runways.—Some recent installations of Morris Overhead Runways are dealt with in Bulletin A-12 which we have just received from the Herbert Morris Crane & Hoist Co., Empress Works, Peter street, Toronto. Reproductions of some excellent photographs of these runways bear testimony to the flexibility and handiness of the system employed. The Morris runway is shown installed in the warehouse, paper mill and foundry, and the modification of the equipment to suit varying conditions is indicated in a very interesting way.

The Graton & Knight Mfg. Co., Worcester, Mass., have sent us a copy of their "Belting Manual" which is a new and enlarged edition of their "care of belting" book. This is an extremely interesting publication containing a lot of useful information regarding belts and their treatment. It includes mechanical rules and tables on belts, belt lacing, belts for special conditions, comparison of various forms of power transmission, etc. A description is given of the method of manufacturing belts, with illustrations of the various processes.

John T. Hepburn, Ltd., Toronto, have issued a pamphlet containing a number of views illustrating their product, which includes brick machinery, hand and electrically-operated traveling cranes, derricks, etc. Illustrations are also given of the works and of several crane installations, indicating the scope of their plant. Copies of this pamphlet will be sent to interested readers.

The Department of the Interior, Bureau of Mines branch of the U. S. Government, Washington, D.C., have published technical paper No. 50, entitled "Metallurgical Coke," edited by A. W. Belden. In this bulletin, the history of coke making in the United States is summarized to indicate the different methods and modern types of ovens, etc. An interesting map is included with the bulletin showing the districts where coke ovens are located.

"**Coal Washing in Illinois,**" by F. C. Lincoln, of the Department of Mining Engineering, has just been issued as Bulletin No. 69 by the Engineering Experiment Station of the University of Illinois. A great amount of data, gathered from experiments made in the mining laboratory of the university, personal visits to the various coal washeries in the State, and a thorough search of the scattered literature on the subject, have been compiled and tabulated in this Bulletin. The Bulletin also contains an article by S. W. Parr, which considers "Moisture in Washed Coals," and is a summary of tests made at the experiment station on carload lots of various washed coals. Copies of Bulletin No. 69 may be obtained upon application to C. R. Richards, acting director of the Engineering Experiment Station, Urbana, Illinois.

16 in. Lever
POST DRILL

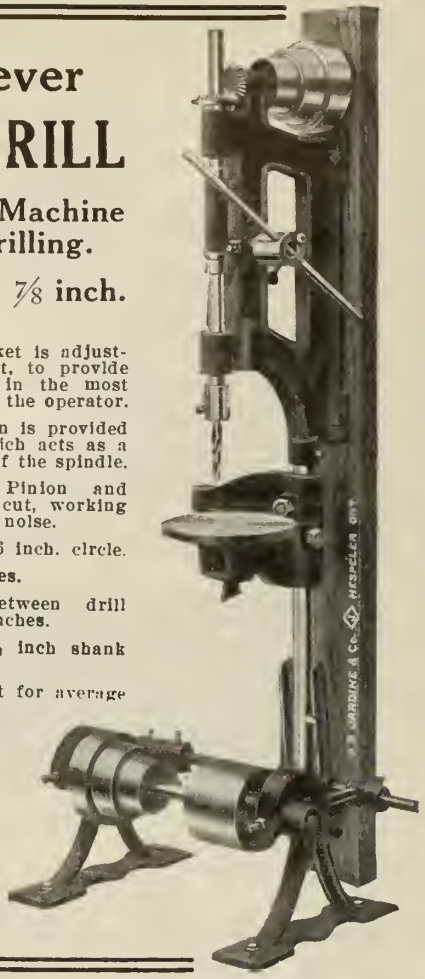
A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.



Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

Speed of countershaft for average **work, 300 per minute.**

A. B. Jardine & Co.

Hespeler, Ontario

"Detroit" Twist Drill Set

Saves Time

This set includes Straight Shank Drills, Steel Wire Gauge, Nos. 1 to 60 inclusive.
The holes into which the drills fit are properly marked, even numbers on one side and odd numbers opposite. Don't waste time "looking." Just pick the drill you want. The stands come in a beautifully oxidized copper effect that resists dirt and rust—practical in shop and tool room.

Repeat orders are the best evidence of a superior tool.

"ERIE" DOUBLE FRAME STEAM FORGING HAMMERS are correctly designed and so well built that repeat orders come to us as a matter of course.

Let us point out to you some of the exclusive and superior features of the "ERIE" HAMMERS.

Erie Foundry Company, Erie, Pa.

The above is our 25 K.W. butt-welder, capacity ¾ in. to 1½ in. round and 2 in. pipe.

Convertible clamps for welding flats and bands.

We make other sizes of butt-welders and a full line of SPOT welders.

Write for catalogue.

AGNEW ELECTRIC WELDER CO.,
WALKERVILLE, ONT. Limited

Cut Your Riveting Costs With a "TOLEDO" WELDER

No. 150 Welder.

This type of machine has been a genuine money-maker for stove manufacturers. The old-time method of riveting steel range bodies, stove runners, etc., has been replaced by "TOLEDO" electric welders in the largest plants throughout the country. A "TOLEDO" welder means a stronger, better and neater job at less than a third of the old cost.

Let us ship you a machine on our free trial plan—then judge for yourself.

Just out—new Bulletins Nos. 14 and 15. Write for them.

NO LEASE. NO LICENSE.

NO ROYALTY.

Drop in and shake hands

WE'RE always right glad to see you—our readers and advertisers—to have a hand-shake, a grouch about the weather, a chat about things in general.

Since we moved up here from Front Street, four years ago, we've been hitherto somewhat inaccessible, and this announcement is to remind you that the "Dundas" car route has been changed, and now runs right past our offices, putting us within four minutes of the down-town district.

The little map shows the car route and the relation of our offices thereto.

All you have to do is to get on any "Dundas" car, downtown, and get off at University Avenue.

As you can now reach us in a few minutes, we shall expect you to look us up, anytime you feel like it.

And, whether you've got any kicks to make, want to talk shop, or just drop around to say "Howdy," we'll be mighty glad to see you.

So—come on in!
